AIM + PRISM

Five preliminary action studies

Targeted commercial checks before broad price support.

Parts families & distributor performance Scenario analysis & investigation priorities

Start with UK braking and UTI profit protection, then test specific price exceptions, Genuine/BVP retention and technical barriers.

Preliminary — not five verified sales declines Billing horizon: 30 June 2026

Executive summary

UK brakes. Validate applications and competitor offers before widening price support.

Pricing exceptions. Investigate the PCV element and clutch kit separately.

Fleet context. Distinguish changes in service demand from weaker purchasing.

Technical friction. Check whether the UK control-unit case is closed before further action.

Transaction level. Distributor purchases are not end-customer demand.

UTI profitability. Strong proposed revenue growth leaves little gross-profit protection.

Quantity matters. A higher selling price can conceal declining purchasing frequency.

Genuine and BVP. Check matched combined quantities before calling a mix change a loss.

Warranty. Use it for defects and repairs, not as proof of scheduled maintenance.

Next decision. Establish the affected family, fleet and euro impact before committing support.

EVIDENCE STATUS

This is a formatted edition of the preceding preliminary assessment. The attached data files are accessible; the earlier statement that no datasets were available was incorrect. The files have not been jointly reanalysed for this edition. Financial cases remain discussion scenarios, not validated actual results.

UK brakes · p. 2 | UTI agreement · p. 3 | Price exceptions · p. 4 | Genuine/BVP · p. 5 | Control units · p. 6 | Evidence · p. 7

AIM is the Aftermarket Intelligence Model, used to classify parts and analyse commercial performance. **PRISM** provides the fleet and service-demand context in this assessment. **BVP** means Best Value Parts.

UK TRUCKS / ISUZU TRUCK UK (ITUK)

Brakes: recover business, not just lower the price

A targeted brake study is more defensible than a family-wide discount.

Commercial pilot candidate | Sales decline not established

What the earlier proposal implies

The quoted brake special price agreement (SPA) raises revenue faster than gross profit. These are a baseline and proposal, **not observed post-agreement results**.

QUOTED MEASURE	BASELINE	PROPOSAL	CHANGE
Revenue	217.9K€	289.5K€	+32.8%
Gross profit	111.0K€	118.6K€	+6.9%
Gross margin	50.9%	41.0%	−9.9 points

93.6% of the proposed business is needed to match baseline gross profit.

110,953 ÷ 118,601. Assumes unchanged proposed mix, selling prices and unit costs.

Source: preceding discussion (D). Exact comparison dates and the source workbook have not been revalidated. K€ means thousands of euro. Calculations use the quoted unrounded totals.

Aftermarket comparison leads

PUBLIC LISTING	PRICE, EXCLUDING VAT	SELLER-LISTED ISUZU REFERENCES
WP126 Four pads	£34.05	8973292660; 8982169220
WP125 Four pads	£36.94	8982169260; 8982447940

Sources: Truckstop Group, WP126 and WP125, retrieved 21 September 2026. Listings are comparison leads, not validated SPA equivalents or firm quotes. No ISZE price premium is calculated.

What the combined study must test

Use AIM to group validated successors, kits and BVP alternatives. Compare purchases with the relevant PRISM fleet and service demand, then check sales to dealers and availability.

What could change the conclusion

Lower purchasing with stable sales to dealers may reflect replenishment timing. Brake-demand assumptions and the applicable fleet still need validation.

RECOMMENDED ACTION

Pilot only matched brake applications.

Track comparable quantities, dealer participation and realised gross profit. Match kit contents, delivery and warranty terms as well as price.

Context: ISZE operational caveats, 19 September 2026 (C). Warranty comparison, subject to terms: ITUK Parts & E-Commerce (W3).

ISRAEL TRUCKS / UNIVERSAL TRUCKS ISRAEL (UTI)

Sales growth can hide a weaker profit outcome

The proposed UTI agreement leaves very little room for missed commitments.

Profit-protection priority | Proposal, not actual agreement performance

The quoted 12-month, 48-line case

QUOTED MEASURE	HISTORICAL BASELINE	PROPOSED SPA
Revenue	731.9K€	1,041.0K€
Gross profit	305.4K€	307.9K€
Gross margin	41.7%	29.6%

+42.2%
Proposed revenue growth versus the quoted baseline

+0.8%
Proposed gross-profit growth versus the quoted baseline

99.2%
Delivery required to match baseline gross profit

Source: preceding discussion (D); source workbook and exact 12-month dates not revalidated. Proposed mix, prices and unit costs are held constant for the sensitivity below.

SENSITIVITY, NOT A FORECAST

At 95% of the proposed business, gross profit would be 292.5K€ — about 13.0K€ below the historical baseline. This assumes the shortfall is proportional across the proposal; a different line mix changes the result.

What AIM should expose

Identify which families deliver commitment and profit, including high-contribution categories hidden by portfolio growth. Distinguish recovered purchases from support on existing business.

What PRISM should challenge

Test whether the applicable fleet and service demand support the proposal. A modelled gap is not a commitment. The supported lines' fleet and application split is not established here.

Use the right alternative scenario

A defensive SPA can still be worthwhile if the realistic no-SPA alternative produces lower sales and profit. Historical profit is a benchmark, **not automatically that alternative**; substantiate the business protected.

RECOMMENDED ACTION

Manage and renew support line by line.

Review monthly commitment delivery, realised gross profit and documented competitive defence. Do not treat high turnover growth as proof that every supported family is successful.

Arithmetic: 305,444 ÷ 307,853 = 99.2%; 307,853 × 95% = 292,460.35. Figures describe the quoted SPA portfolio, not a measured market loss. UTI remains separate from Universal Motors Israel (UMI).

ISRAEL / DISTRIBUTOR AND REFERENCE TO BE CONFIRMED

Investigate price exceptions, not the market average

The reported PCV-element and clutch-kit discrepancies justify individual checks, not a broad Israel discount.

Targeted price validation | Comparator basis unresolved

What the earlier discussion reported

The earlier price pairs do not establish whether the lower value is a prior ISZE price, competitor offer or different transaction level.

REPORTED ITEM	LOWER FIGURE	HIGHER FIGURE	DIFFERENCE
PCV element	7.50	11.25	+50.0%
Clutch kit	135.00	164.07	+21.5%

Source: preceding discussion (D). Currency, tax, exact references, dates and transaction basis are unverified. These are reported price pairs, not validated increases or premiums. The PCV label needs catalogue confirmation.

WHY QUANTITY MUST BE CHECKED

A genuine 50% like-for-like price increase can conceal a one-third quantity fall while revenue stays flat. That is arithmetic, not an observed outcome for either item.

$$1.50 \times 0.667 \approx 1.00$$

Price index × quantity index ≈ unchanged revenue.

Establish an equivalent price

Confirm reference, kit contents, tier, date, currency, tax and transaction level. Then check source cost, exchange rate, margin and agreed support.

Keep UTI trucks and UMI light commercial vehicles separate.

Test the purchasing response

Use AIM to include validated alternatives and successors. Compare like periods before and after the pricing event, using applicable fleet context rather than a national total.

The exact part population and affected fleet remain unidentified.

Apply the appropriate demand assumption

A scheduled-service item needs validated maintenance and usage assumptions. Clutch wear must not inherit a routine-filter replacement frequency; warranty cannot establish either interval.

RECOMMENDED ACTION

Open an exception review on the exact references.

Choose among a price correction, targeted SPA, validated BVP alternative or explanation of a non-equivalent comparison only after the price basis and purchasing response are confirmed.

This is a pricing-precision hypothesis. No affected-fleet count, recoverable euro value or price-driven sales loss is claimed.

GENUINE + BEST VALUE PARTS / DISTRIBUTOR PILOT TO BE SELECTED

Separate BVP retention from business lost outside Isuzu

A Genuine decline is not automatically a commercial loss when matched BVP purchases rise.

Strategic study hypothesis | No market decline identified yet

The question worth answering

Where the applicable vehicles continue to generate service demand, are purchases retained through the right Genuine/BVP offer, or are both declining?

ITUK positions BVP as an alternative for older vehicles and lists filtration, belts, bearings, starters, alternators, wipers and braking components. This supports studying these families; it does **not** validate an alternative for every part number.

Source: ITUK Parts & E-Commerce, retrieved 21 September 2026 (W3). BVP availability and applicability require reference-level confirmation.

Three patterns, three different actions

Genuine down; matched BVP up	If combined comparable quantities remain stable, the change may be retention through a different mix. **Check total gross profit before adding support.**
Both down; demand stable	If relevant modelled demand remains stable, weaker channel purchasing is a candidate for investigation. **Check competitiveness, availability and dealer purchasing.**
Purchases down; fleet or use down	If the relevant active fleet or usage declines too, a structural demand reduction may explain the pattern. **Adjust forecasts and stock plans before recovery support.**

AIM: compare like with like

Match product tiers, successors and kit contents. A set, kit and individual component cannot automatically be added as interchangeable units.

PRISM: use the right fleet

Use historical fleet and suitable usage evidence. Age alone does not prove rising demand. Keep multi-application parts pooled unless attribution is exclusive.

RECOMMENDED ACTION

Choose a distributor and family with strong evidence coverage.

Target validated applications with continuing demand and a documented offer gap. Avoid a blanket older-vehicle promotion and avoid using a network BVP mix as the target.

Decision boundary. No measured family loss or recoverable euro amount is claimed. Historical fleet information through 2025 is usable; the current forecast beyond 2025 is not suitable for quotation. Source: ISZE figures and caveats, 19 September 2026 (C).

UK TRUCKS / ITUK

Remove technical friction before discussing price

Check the control-unit case for closure; reopen action only if the issue remains unresolved.

Technical-closure check | June 2026 case — current status unverified

The reported case

The earlier discussion concerned an NPR control-unit installation and distinguished a service/software reference from a hardware reference. It recorded disagreement over programming versus installation damage.

8984869511	Service/software reference, as described in the earlier case
8975440040	Hardware reference, as described in the earlier case

Source: preceding discussion of the June 2026 ITUK case (D). Catalogue status, technical evidence and closure have not been revalidated. These references must not be treated as interchangeable.

> DO NOT TURN A CASE INTO A FLEET-WIDE FINDING
>
> Four of eight units were reported as problematic in that case. This is **neither a population-wide failure rate nor proof of the technical cause**. The affected application population and associated commercial cost are not established here.

The commercial hypothesis

An unresolved installation or programming problem could discourage repeat orders. Returns, credits and replacements could also obscure paid demand.

Neither effect has been measured for these references in this assessment.

The evidence required

Check the correct catalogue application, programming records, diagnostic evidence, claims, returns and credits, then examine subsequent purchasing.

Use the validated affected fleet, not all ITUK trucks, as the population.

Warranty has a specific role here

Warranty informs the defect and repair investigation, not maintenance participation, overall servicing or market share. A hardware-only price is not equivalent to a programmed service solution.

RECOMMENDED ACTION

Confirm closure and the correct ordering/support route.

If unresolved, complete the technical determination through ITUK before assessing any residual commercial barrier. If the case is already closed, do not revive it as an open action.

Commercial boundary. No verified like-for-like aftermarket price, euro sales loss or affected-fleet count is available for this case in the preceding assessment. A price concession would not by itself resolve installation or programming uncertainty.

EVIDENCE AND DECISION RULES

From a candidate study to a commercial decision

Confirm what changed, why it changed and what action would improve the outcome.

Classify the change

AIM should identify the family, validated replacements, Genuine/BVP relationship and comparable unit basis. Review both quantities and euro values.

Establish the relevant fleet

PRISM and units in operation (UIO) provide the applicable historical fleet and service context. Do not allocate shared parts to vehicle bands by fleet share.

Use spending and service context

Use the Genuine Parts Share (GPS) analysis through measured spend per truck and modelled target spend. Periodic maintenance service (PMS) cover compares measured purchasing with modelled demand.

Validate the market offer

Match references, kit contents, quality tier, transaction level, date, tax and delivery terms. Public prices alone do not establish an ISZE price gap.

Test alternative explanations

Check availability, order timing, returns, credits, warranty repairs and supersessions before attributing a decline to competitors.

Choose a bounded action

State the affected family, applicable fleet, euro impact and measurable outcome. A modelled gap is not automatically recoverable sales or profit.

> **COMPARISON DISCIPLINE**
>
> Billing runs to **30 June 2026**; 2026 is a half year. Compare matching periods. Keep ITUK separate from Isuzu UK (IUK), and UTI separate from UMI. Keep parts billed, sales to dealer and dealer-to-customer sales distinct. Missing dealer information means unknown, not zero.

Source and verification record

D — Preceding preliminary assessment. Basis for the two SPA scenarios, reported Israel price pairs and June control-unit case. Original workbooks, exact commercial periods and latest closure evidence were not revalidated. Arithmetic was checked for this report.

C — ISZE business context, figures and operational caveats. Prepared 19 September 2026. Used for distributor boundaries, the billing horizon, forecast restrictions and the provisional ITUK brake-demand assumption. It does not independently validate the SPA figures.

W1 — Truckstop Group: Brake Pads WP126. Listed price and supplier cross-references retrieved 21 September 2026.

W2 — Truckstop Group: Brake Pads WP125. Listed price and supplier cross-references retrieved 21 September 2026.

W3 — Isuzu Truck UK: Parts & E-Commerce. Genuine two-year parts warranty (including labour when dealer-fitted, subject to terms) and BVP positioning, retrieved 21 September 2026. Application checks apply.

What this edition establishes — and what it does not

The attached billing, warranty, dealer-sales and derived files are accessible. This formatting edition has not joined and reanalysed them to establish five actual sales trends. The report preserves the earlier investigation priorities, labels the financial sensitivities as scenarios and refreshes the cited public comparison leads.

The action order is an investigation priority, not a ranking of proven losses. No raw billing lines, full price list, future fleet forecast or combined network service-demand euro gap is reproduced.
