ISUZU

MOTORS EUROPE

COMMERCIAL VISION
AND PARTICIPATION

Universe

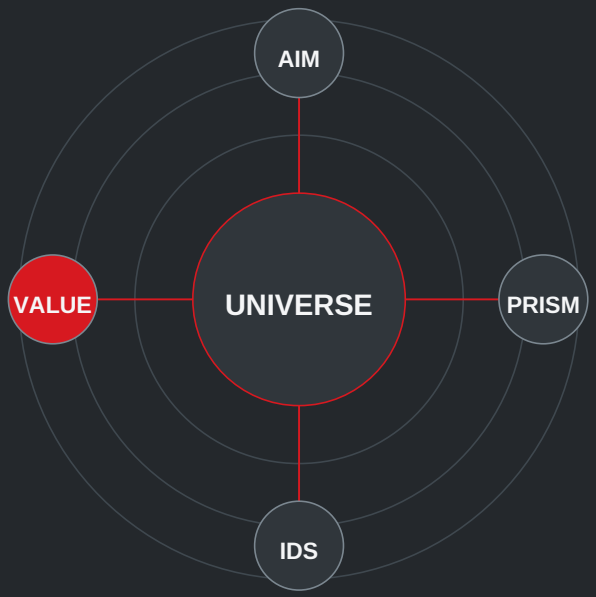

Stronger businesses. Connected intelligence.

An Isuzu commercial programme that connects product knowledge, deep purchasing analysis and dealer development with practical ways to grow the parts business.

AIM / ATLAS

IDS

PRISM

Explore the opportunity. Develop the offer. See what changes.

22 September 2026 / White paper for discussion

THE PROPOSITION

A reason to participate

Give the network capabilities worth using, and make relevant information improve the value returned.

Universe is a proposed commercial programme for Isuzu Motors Europe (ISZE), national distributors and their dealers. It brings together an unusually specific combination: Isuzu parts knowledge, the composition of the parts business, dealer self-assessment and the market in which vehicles operate. The purpose is to help participants make stronger commercial choices, individually and with the relevant Isuzu functions.

The programme starts with recognisable foundations. The Aftermarket Intelligence Model (AIM) and the Atlas make the product range and purchasing history explorable. Isuzu Dealer Standards (IDS) supplies a recorded self-assessment and a basis for development. PRISM contributes commercial and historical fleet context. Universe connects these capabilities without requiring every commercial activity to use all of them.

Three developed examples show the ambition: a coordinated tender proposition for headquarters, an interactive dealer-development record showing progress, and a data-informed Deal of the Day. These are examples of what the programme could enable, not a closed application catalogue. Future additions should earn their place through a clear participant benefit and a workable information exchange.

The relationship is private and purposeful. Each distributor works with ISZE on its own information; a tender can include specifically authorised Isuzu entities. Participants gain useful tools and commercial opportunities. ISZE gains better evidence for where to direct effort, how to improve the offer and what the resulting activity achieved.

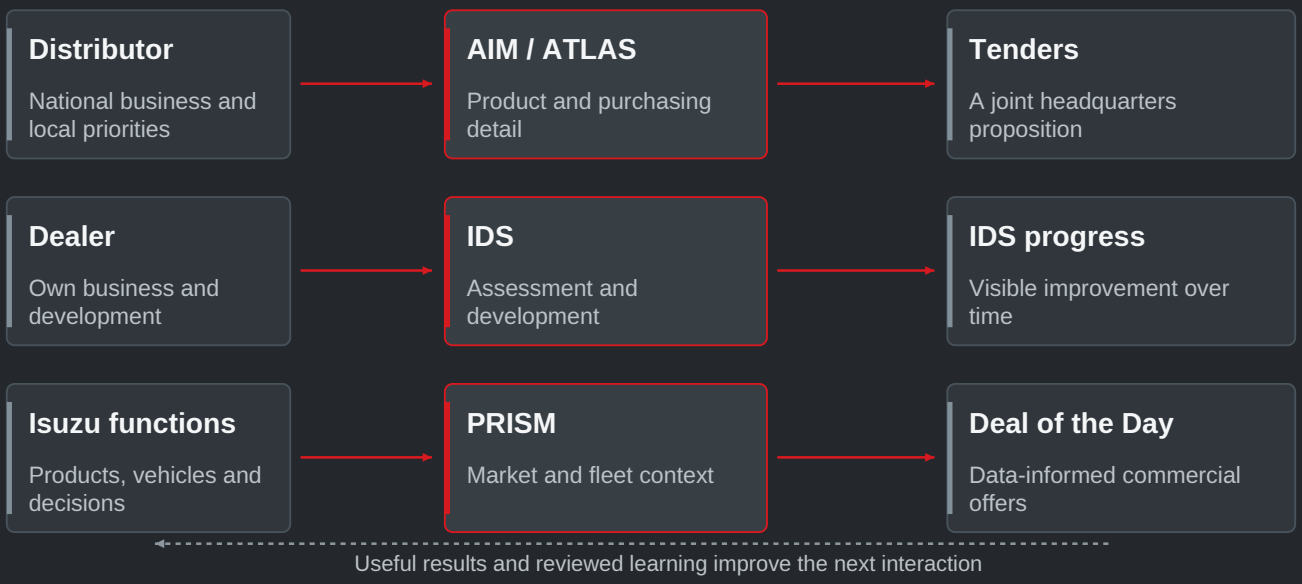

> **The programme succeeds when the participant can identify a better choice, a useful commercial output or visible progress in its own business.**

U; C pp. 6, 8-9; W pp. 43-49

THE WHOLE UNIVERSE

Different knowledge. A stronger combined offer.

AIM, IDS and PRISM are foundations. Applications connect them to the work a participant chooses to do.

Proposed design / relationships, not measured effects.

The architecture is commercial rather than organisational. Product knowledge explains what is being bought. Account history explains where and when recorded purchasing changes. Dealer assessment describes declared practices. Fleet and market information help establish whether a proposed initiative is relevant.

The same foundations can support several applications. A tender proposal draws on vehicle, parts and market knowledge. An IDS development project uses the assessment and selected commercial context. A Deal of the Day uses an eligible product selection, a defined audience and a supported commercial scenario. Each retains the distributor, reporting period and source basis it actually uses.

U; C p. 6; W pp. 48-50

READING THE PAPER

From insight to commercial development

The full argument, the application examples and the operating reference are designed to be read at different depths.

The first chapters explain why the programme belongs together and what participants receive. The middle develops the analytical foundations and three concrete application examples. The final chapters explain how participation, investment and repeatable operation could work, followed by practical reference material.

Historical observations retain their original source periods. Application designs, participant journeys and feedback diagrams are proposals as of 22 September 2026. Numerical scenarios are explicitly hypothetical; they illustrate the economics of a choice rather than forecast demand or report an achieved result.

Section	Pages
The commercial proposition and connected model	5-10
AIM and the Commercial Atlas	11-21
IDS and visible development progress	22-30
PRISM and coordinated tenders	31-41
Deal of the Day	42-54
Participation, economics and delivery	55-70
Methods, working records and sources	71-80

P

THE COMMERCIAL OPPORTUNITY

See beyond the turnover total

A total describes scale. Product, account and market context explain where a useful decision could be made.

A distributor can have a stable parts total while the composition of its business changes considerably. Some ranges may be expanding, others may be bought less frequently, and a change in product mix may conceal a change in quantity. A dealer may see these movements locally without having the product classification or wider market context needed to interpret them.

Universe is designed to make this information commercially navigable. The participant should be able to identify which products contribute to a movement, compare an appropriate period, inspect the relevant product relationships and decide whether the pattern merits a range, development or promotional initiative. A valid conclusion may be to protect the existing offer rather than intervene.

The advantage comes from relating evidence that is usually held for different purposes. A parts classification becomes a commercial language. An assessment becomes an interactive development resource. A tender notice becomes the starting point for a coordinated proposal. A promotion becomes an opportunity to learn about the offer rather than simply record orders during a discount window.

This is also a way to concentrate effort. A supported question about a specific range is more actionable than an undifferentiated national target. The information should help the distributor choose a relevant next step, while allowing ISZE to assess where its own contribution would materially change the proposition.

C pp. 6-14; W pp. 48-51

VALUE FOR EACH PARTICIPANT

The benefit must reach the contributor

The person authorising an exchange, preparing the information and using the tool may be different.

Distributor

Choose priorities, develop the offer and prepare stronger initiatives.

Dealer

Understand its own business and see practical development progress.

Isuzu functions

Assess a better-defined commercial proposal and learn from its result.

Illustrative design / independent requirements and outputs.

A distributor manager needs a defensible view of national and network priorities. A parts manager needs the products behind those priorities and practical choices for developing the offer. A dealer principal needs a useful view of the business it controls and a way to examine development progress. The administrator preparing a submission needs fewer repeated requests and a clear correction route.

Headquarters gains a more structured decision: the commercial purpose, eligible scope, evidence, requested contribution and expected learning. ISZE gains a better basis for product and market decisions. Those benefits are related, but one party ordering more parts does not by itself establish that every participant gained.

The first invitation should therefore name the output the recipient will receive. It can be a prepared Atlas analysis, an IDS development view or a specific commercial application. Asking for additional information makes sense when the contributor can see how it improves that output.

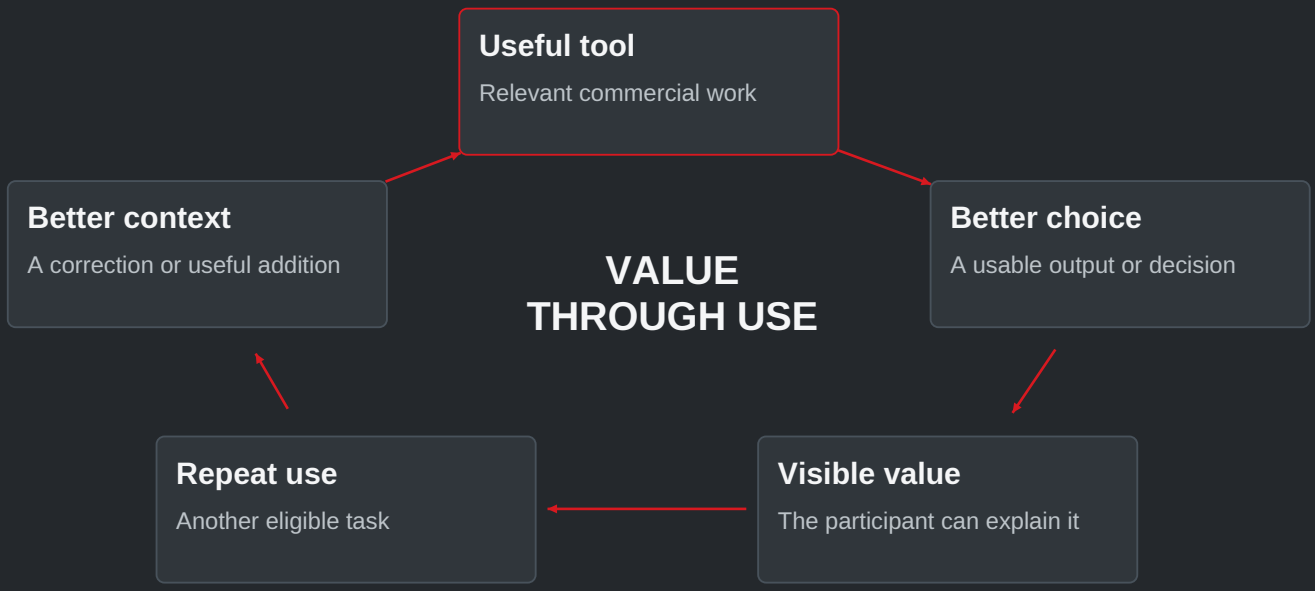

U; W pp. 9-12, 32-35; C pp. 16-22

POSITIVE DYNAMICS

Useful tools earn better context

The mechanism to test is reciprocal value, not a larger reporting obligation.

The proposed reinforcing mechanism begins with a useful capability. A participant uses it to understand a relevant issue or develop an offer. A visible benefit provides a reason to return. The participant can then correct the evidence or add the specific context that makes the next analysis better.

Proposed feedback mechanism / no measured causal effect is implied.

This mechanism is conditional. Repeated requests, unclear benefits or an unreliable interpretation can weaken participation. The programme should observe whether people return for eligible commercial work and whether the extra information actually changes the analysis. Submission counts alone do not establish voluntary value.

Learning should accumulate in the product and the method: a better account relationship, a clearer product definition, a more relevant selection rule or a reviewed example. It need not accumulate as unrestricted copies of each participant's commercially sensitive records.

P; W pp. 43-47, 55-58

THE RELATIONSHIP MODEL

Private relationships. Selected collaboration.

Share the work with the people who need it, while keeping each distributor's business distinct.

Proposed access pattern / distinct private relationships and explicitly selected collaboration.

Each distributor has its own analytical context, initiatives and authorised outputs. ISZE can compare supported evidence internally where permitted, but one distributor does not gain access to another distributor's commercial submissions, campaign plans, comments or pending support requests.

A joint tender is a specific collaboration, not a general network discussion. The lead distributor and the relevant vehicle, parts and headquarters functions work on a defined opportunity. Access follows the role in that opportunity and the information each function needs. Membership is deliberate and can change when the work changes.

Useful learning can still travel. ISZE may publish a reviewed product explanation, method or appropriately controlled example after checking its confidentiality and scope. The original commercial record remains private. Contributors retain a route to correct factual errors in an account of their work.

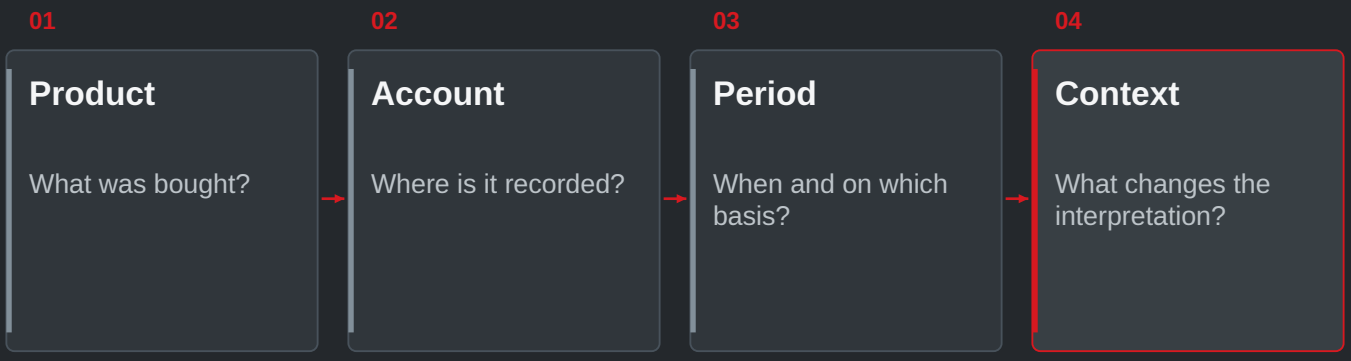

The result is a network that benefits from shared expertise while each distributor retains a private commercial relationship with ISZE. Information access must ultimately be enforced by the operating application and by the contents of exports, not merely by hidden menus.

U; W pp. 44-49, 68-69; R p. 8

CONNECTED KNOWLEDGE

Connect evidence without flattening it

A common experience is useful because the underlying sources answer different questions.

Proposed sequence / each stage retains its own evidence and decision.

Parts billed by ISZE describe sales to the distributor. Sales to dealer describe the next purchasing stage. Workshop observations describe selected recorded work. An assessment describes a dealer's answers to a questionnaire. A fleet reference describes a defined vehicle population. A public offer describes what a seller advertised on a particular basis.

The product should make these distinctions understandable while preserving useful navigation. A participant can move from an account to a product family, then to the original references and a selected application. The original reporting period stays attached, even when another source has a different date.

Connections should explain their purpose. Linking a product family to an assessment item may prompt a useful development discussion; it does not establish that the recorded practice caused the purchasing result. Linking a fleet reference to a range can add context; it does not automatically identify which dealer services those vehicles.

W pp. 48-51; C pp. 6, 8

AN EXPANDABLE PROGRAMME

Applications can develop as value becomes clear

The foundations are stable; the portfolio of useful applications remains open.

Tender collaboration, IDS progress and Deal of the Day demonstrate different types of value: a coordinated commercial proposition, a visible development journey and a targeted offer informed by data. They provide concrete ways to test the programme without defining its permanent limits.

Tenders

A coordinated proposal for the relevant Isuzu entities and headquarters.

IDS progress

An interactive development record with evidence of implementation.

Deal of the Day

Selected products, relevant audiences and transparent campaign economics.

Illustrative design / independent requirements and outputs.

Other applications could follow when a participant need, usable evidence and an accountable operating method are established. Possibilities include selected fleet-cost comparisons, privately prepared range studies and product-value evidence. These remain candidate applications, not a commitment to commission every idea.

A new application should explain what becomes possible, who benefits, what additional information is required and what the programme must do in return. It should reuse the existing product and account context wherever that context is fit for purpose.

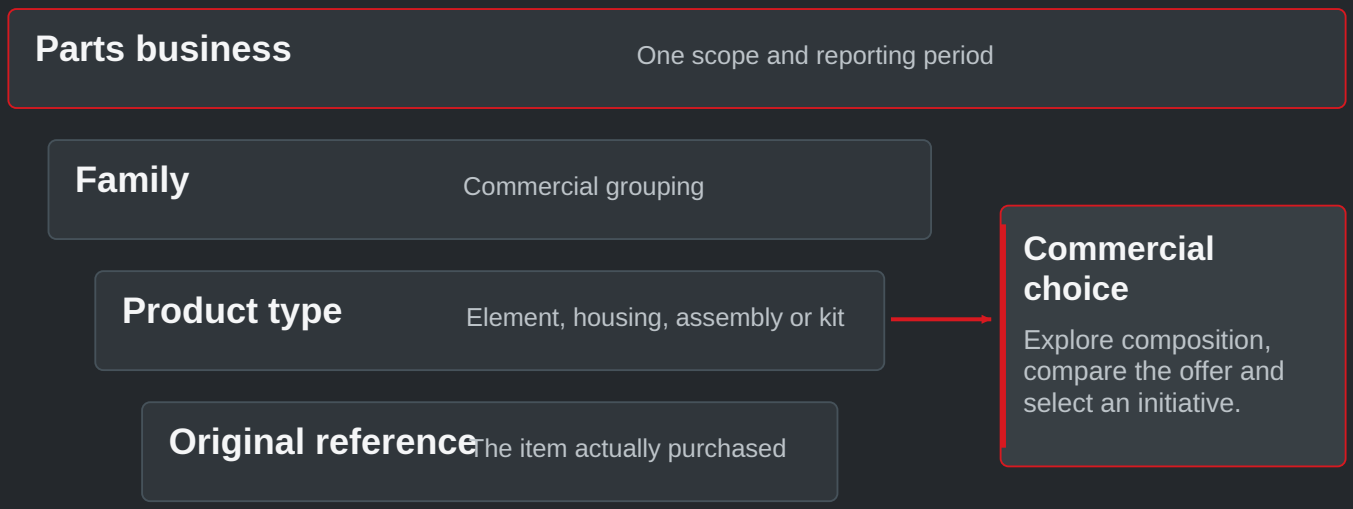

Expandability is a product choice, not an access policy. The programme can be open to further useful applications while keeping participant information private and the scope of every collaboration controlled.

U; P; W pp. 53-59

AIM / COMMERCIAL ATLAS

The product range becomes a commercial language

Explore the composition of the business rather than treating every part number as an isolated line.

Proposed design / relationships, not measured effects.

The Atlas should make AIM's detailed classification useful to a commercial reader. Start with the covered business, then navigate through families, product groups, detailed product types and original references. At each level, show the composition, the period and the evidence that explains a movement.

This is more than a catalogue tree. The same structure can support the comparison of Genuine and Best Value Parts (BVP), the identification of the references behind a change and the preparation of a selected campaign. It can also show where a category definition is too broad for the decision being considered.

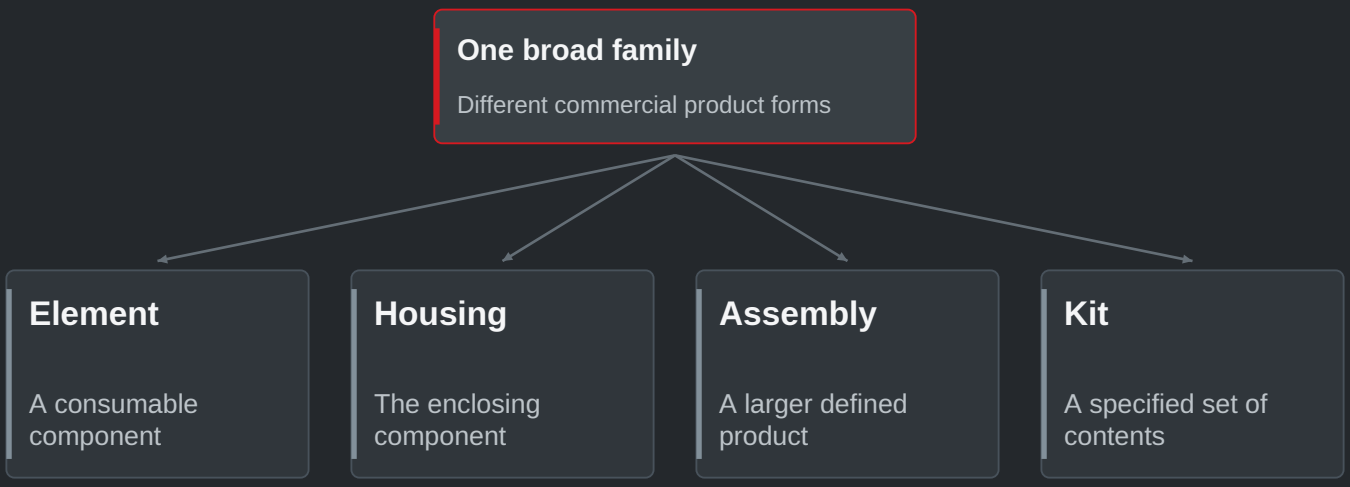

The participant should be able to explore beyond a ranked exception list. A range that is growing may reveal a development opportunity, and a stable range may be important to protect. The useful tool supports curiosity as well as prioritisation.

C p. 6; W pp. 15, 24, 48-51

AIM / PRODUCT MEANING

A filter element is not a filter housing

Detailed product identity prevents attractive but meaningless comparisons.

Proposed design / relationships, not measured effects.

The commercial meaning of a category depends on what it contains. An element, housing, assembly and service kit can sit near each other in a product tree while having very different prices and use. Combining them into one average unit price may describe a changing mix rather than a change in price.

AIM provides the grouping language. The original reference remains the identity of the transaction. Catalogue relationships describe successors or candidate alternatives on their documented basis. Technical application evidence supplies a separate judgement about fitment. These distinctions should survive every chart and export.

For a commercial comparison, product form and contents matter alongside the price. An axle kit and a single component cannot be compared as though they were equal quantities. A cheaper offer may have different contents; a more expensive one may not be more complete. The Atlas should help the user identify the precise comparison before discussing the commercial response.

A missing relationship should remain a visible gap in the selected analysis. It should not be filled with a plausible match based only on similar wording. Conversely, a missing pairing for one reference should not be described as proof that no BVP range exists in the wider family.

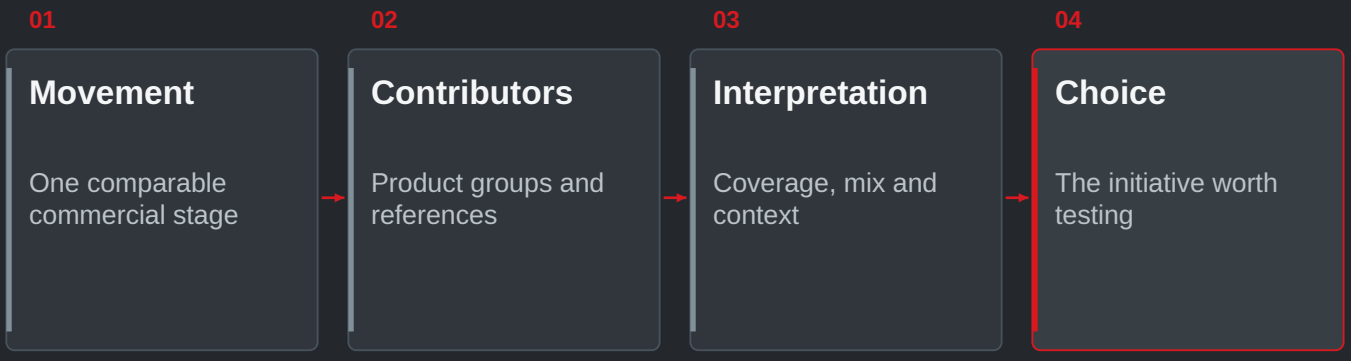

C p. 6; W pp. 24-25, 50-51

AIM / DEEP SALES ANALYSIS

Explain the movement in layers

Change in revenue, quantity, mix and purchasing timing are different observations.

The first layer shows a comparable period on one commercial stage. The next identifies the product groups and original references contributing to the change. Further views distinguish quantity, recorded average revenue per unit, Genuine/BVP composition and monthly purchasing pattern where supported.

Proposed sequence / each stage retains its own evidence and decision.

The question then becomes more precise. Is the movement broad or concentrated? Does the source cover the same accounts? Are replacement references involved? Is a change in the average caused by a different product mix? A useful investigation can reduce the range of explanations without claiming to know the customer's motive.

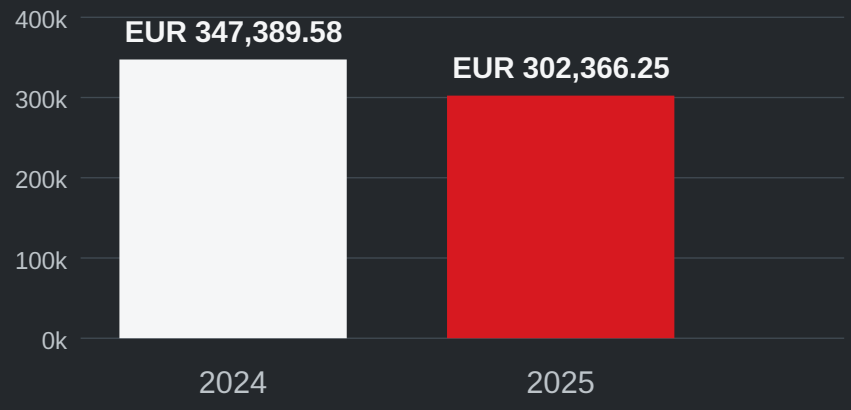

Only then should the user choose a commercial response. The response might be a selected range study, campaign proposal, competitive comparison or decision to keep the offer unchanged. The Atlas should retain the original observation, so later information improves the interpretation without rewriting what was originally recorded.

C pp. 7-14; W pp. 49-51

HISTORICAL EXAMPLE / ITUK

A revenue-only view misses part of the change

ITUK brake-pad source-category billing fell less than its recorded quantity between full calendar years 2024 and 2025.

-13.0%
Parts billed

-25.4%
Recorded quantity

22,389 trucks: market context, not the eligible pad fleet.

Recorded ISZE billing / ITUK brake-pad source category, CY2024 vs CY2025. M; F; source 19 Sep 2026.

ISZE parts billed in the supplied brake-pad source category declined from EUR 347,389.58 in 2024 to EUR 302,366.25 in 2025, a reduction of EUR 45,023.33 or 13.0%. Recorded quantity moved from 4,562 to 3,402, a reduction of 25.4%. The difference merits a closer look at the contributing references and commercial mix.

The comparison describes ITUK distributor purchasing. It does not establish a like-for-like price increase, lost customer demand or a justified discount. The contextual fleet is 22,389 trucks on the supplied calendar-2025 spend-per-truck basis, using the March 2026 vehicle register. It is not the eligible population for every pad reference.

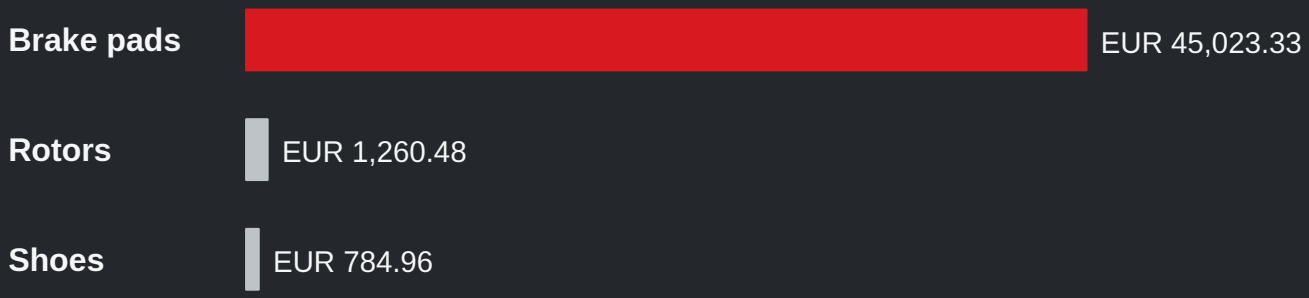

The practical value of the Atlas is the next level of explanation: which original references contributed, whether product composition changed and what a compatible sales-to-dealer view adds. A single percentage cannot answer those questions.

M: ITUK brake-pad category, CY2024/2025, source 19 Sep 2026; F: 2025 context; C pp. 7, 10; arithmetic checked 22 Sep 2026

HISTORICAL EXAMPLE / ITUK

Concentrate the review where the change sits

Brake pads account for 95.7% of the reduction across these three selected braking source categories.

95.7% of this selected reduction sits in the pad category.

Magnitude of billing reductions / three selected ITUK source categories, CY2025 vs CY2024. M; F.

The selected brake-pad, rotor and shoe categories declined by EUR 47,068.77 in ISZE parts billed to ITUK between full calendar years 2024 and 2025. Brake pads contributed EUR 45,023.33, rotors EUR 1,260.48 and shoes EUR 784.96. This is a comparison of the selected source categories, not the entire AIM braking family.

The result helps prioritise investigation. It does not support applying the same remedy to every braking product. A category can have a different quantity pattern, composition and local explanation even when all three billing totals are lower.

The contextual fleet remains 22,389 ITUK trucks on the stated 2025 basis; no dealer allocation is made. The next commercial decision should be based on the eligible references and their evidence, rather than treating the historical reduction as recoverable revenue.

M: ITUK selected brake categories, CY2024/2025; F; C p. 11; arithmetic checked 22 Sep 2026

HISTORICAL EXAMPLE / PORTUGAL

Read Genuine and BVP together

The combined clutch-kit business increased even while the Genuine component declined.

Recorded ISZE billing / I Motors clutch-kit source category, full CY2024 and CY2025. M; F.

For I Motors, Portugal, the supplied clutch-kit source category shows Genuine billing of EUR 2,901.92 in 2024 and EUR 2,057.86 in 2025. BVP billing moved from EUR 27,057.95 to EUR 29,644.61. Combined ISZE parts billed increased from EUR 29,959.87 to EUR 31,702.47: EUR 1,742.60 or 5.8%, across two full calendar years.

Recorded quantity was almost unchanged at 462 kits in 2024 and 461 in 2025. A Genuine-only view would present an incomplete commercial picture. The useful question concerns the combined offer, product contents and contribution, rather than assuming every Genuine reduction is business lost to a competitor.

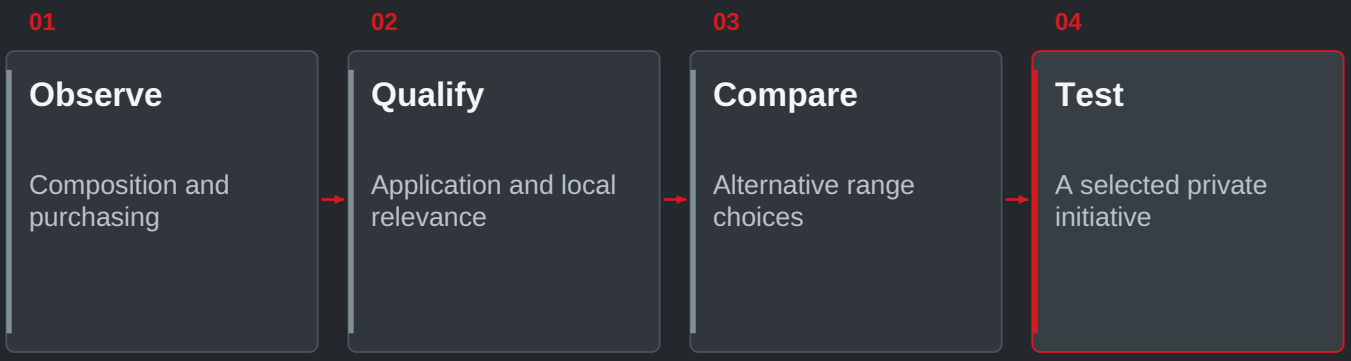

The supplied 2025 market context is 8,176 vehicles. It is not the eligible fleet for these kit references and cannot be allocated to Portuguese dealers. The data does not establish individual customer switching or the gross-profit effect of the change.

M: Portugal clutch-kit category, CY2024/2025; F: 2025 context; C p. 12; arithmetic checked 22 Sep 2026

AIM / RANGE DEVELOPMENT

Choose the range worth developing

A purchase pattern is a starting point for a range decision, not proof of unmet demand.

Proposed sequence / each stage retains its own evidence and decision.

The Atlas can help a distributor examine where its purchasing is concentrated, which product forms are represented and how the Genuine/BVP composition changes. It can compare the selected range with the distributor's own history and with a relevant fleet context when supported.

A proposed range initiative needs a commercial purpose. It may broaden an offer for a defined application, improve the composition of a package or investigate a recurring competitive concern. The purpose determines which references and observations matter.

Range discussions remain private between the distributor and ISZE. ISZE can review similar evidence from other permitted sources internally, but the programme does not create a shared distributor proposal board or reveal who has raised an objection. A central product-development case is a possible later use of reviewed evidence, not the main participant experience.

A useful output is a selected range brief: the original references, relevant applications, observed purchasing, current uncertainties and the proposed test. The participant should be able to decide that the range is not appropriate and preserve the reason rather than have a missing purchase automatically classified as an opportunity.

U; W pp. 24-25, 49-51; P

AIM / ACCOUNT CONTEXT

Preserve the level the source actually supports

Useful national analysis and useful dealer analysis need not look identical.

National information

Product composition and period comparisons. No invented dealer attribution.

Named accounts

Supported own-account purchasing. No invented service population.

Assessment context

Recorded IDS answers. Relationship validated before joining.

Illustrative design / independent requirements and outputs.

A national part-by-month source can explain range composition and purchasing over time. A named-account source can additionally show where activity sits within the covered network. Neither alone establishes end-customer demand or the vehicle population served by a dealer.

The supplied pilots deliberately start at different levels. ITUK has calendar-2025 named purchasing-account information suitable for within-year analysis on its covered basis. The Portugal pilot has national purchasing information and separate dealer self-assessment context, but no purchasing attributed to individual Portuguese dealers in the described source.

The experience should remain valuable at both levels. A distributor can use a national range study or prepare a campaign framework before individual dealer targeting is available. A dealer can use its own IDS development tools without the programme inventing an account history for it.

Adding a validated account relationship is useful because it enables a specific view. It is not a general maturity badge. Combined accounts remain combined until the source supports a split, and a physical site is not inferred merely from a similar name or country label.

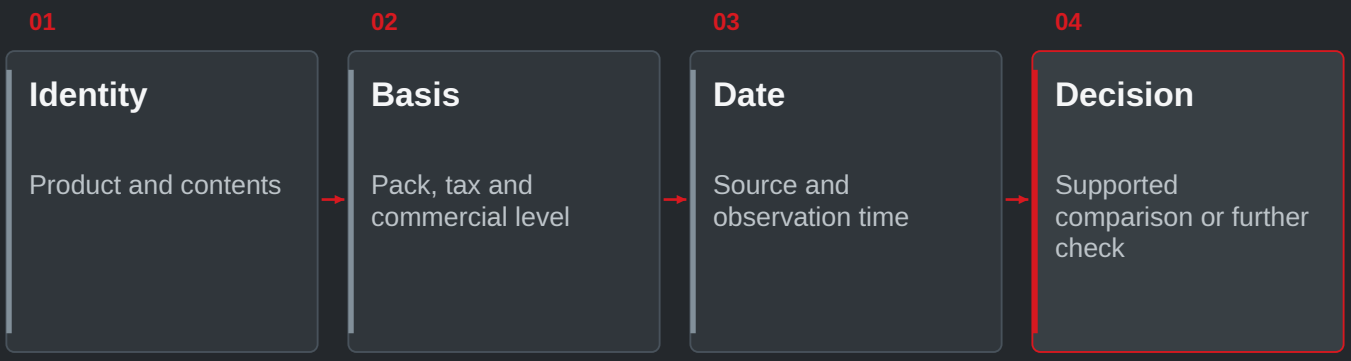

C pp. 8, 37; W pp. 49, 54, 56-57

AIM / COMPETITIVE POSITION

Compare the offer, not just the price

A price observation becomes useful only when the commercial comparison is understood.

A selected comparison should retain the product, contents, application evidence, unit or pack quantity, currency, tax basis, observation date and commercial level. A public advertised price is a market observation, not a record of what a customer paid. A retail offer is not directly equivalent to ISZE's net price to a distributor.

Proposed sequence / each stage retains its own evidence and decision.

The tool can help the user find which parts of the comparison are supported and which require further evidence. It should display an unresolved match as unresolved rather than turn an attractive price into a recommendation. A range can need better positioning even when a particular discount is not justified.

The commercial contribution can be an avoided mistake: comparing complete kits rather than individual components, separating a current offer from an old listing, or retaining a correct price when the observed change had another explanation. Such a decision is useful without attaching an invented financial saving to it.

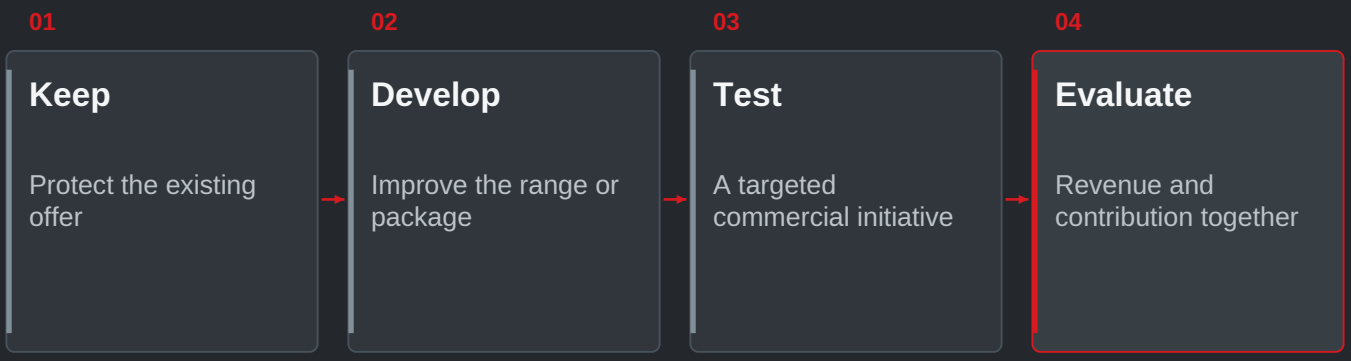

Participant-specific prices and future commercial plans stay within the authorised bilateral assessment. Wider learning can concern product contents or the method of comparison without revealing another distributor's negotiated terms.

C pp. 13-14, 25-26; W pp. 24-25, 45, 50-51

AIM / COMMERCIAL CHOICES

The best choice is not always a price change

A decision tool should make alternative actions comparable.

Proposed sequence / each stage retains its own evidence and decision.

For a selected range, the tool can organise several possible decisions: retain the existing offer, investigate product composition, develop a targeted promotion, seek a manufacturer contribution or test a supported price change. Each alternative should state the commercial objective and the evidence it requires.

Where the inputs permit arithmetic, show revenue and gross profit together. A revenue objective and a gross-profit objective may rank alternatives differently. A lower margin percentage can coexist with higher gross profit, but only if the eligible volume and cost assumptions support it. A scenario is not a demand forecast.

The current AIM decision rules define gross profit using the applicable net selling price less documented parts purchase cost. Freight, duty, overheads, distributor kickbacks and other operating costs sit outside that measure. Any programme evaluation should show additional costs separately rather than quietly change the meaning of gross profit.

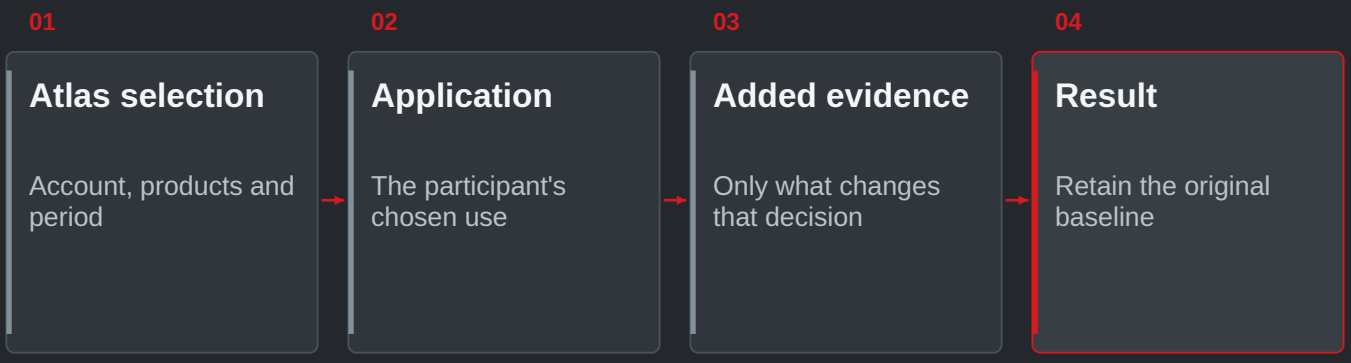

The selected decision should retain its baseline, eligible scope and assumptions. Later observations can then be compared with the original proposition. That is more useful than presenting a new attractive scenario every time the data changes.

AIM decision component v0.3, confirmed calculation rules, 22 Sep 2026; C pp. 13, 27; P

AIM / INTO APPLICATIONS

Carry the useful context forward

An insight should become usable in a chosen application without being reassembled.

Proposed sequence / each stage retains its own evidence and decision.

An Atlas selection can carry its market, purchasing account or national scope, original references, comparison period and source version into a Deal of the Day proposal. Relevant product evidence can be reused in a tender proposal. A commercial pattern can inform a dealer-development discussion where the assessment relationship is validated.

The application adds what is missing for its own purpose. Deal of the Day adds campaign timing, audience, eligible quantities and proposed terms. A tender adds requirements, participating entities and requested headquarters decisions. IDS development adds an agreed objective, evidence of implementation and review milestones.

This connection does not turn every analytical observation into an instruction to launch activity. It makes a chosen initiative easier to prepare and its result easier to interpret. The user should also be able to keep an analysis as a saved review with no further action.

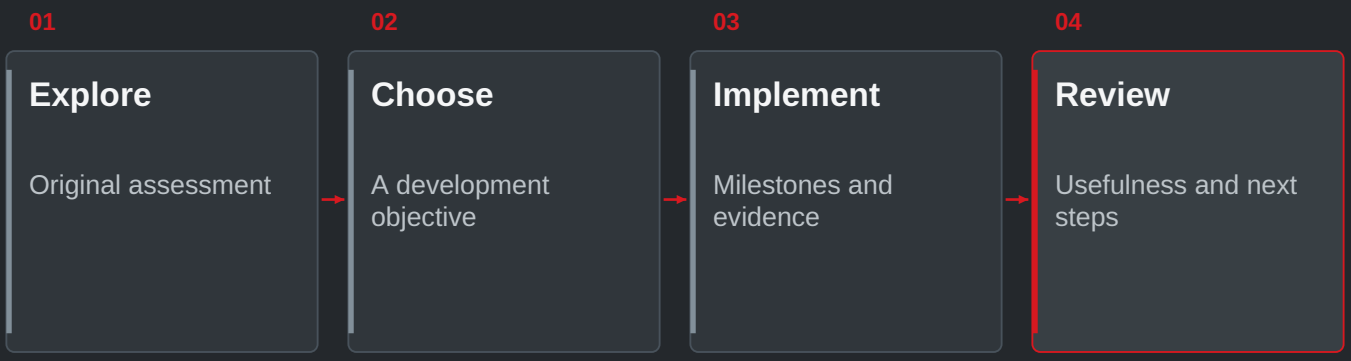

P; W pp. 48-54; R pp. 3-6

IDS / DEVELOPMENT

Make development visible

An interactive IDS experience should help a dealer choose a priority and see what has changed.

Isuzu Dealer Standards records the dealer's self-assessment. Universe can make that information easier to explore by section and question, retain its source wording and help the dealer turn a relevant priority into a development project. The product value is the ability to understand, choose, act and review in one coherent view.

Proposed sequence / each stage retains its own evidence and decision.

The dealer remains an active participant. A development objective is selected with the distributor, rather than automatically imposed by a low score. The objective can concern the way the business manages its range, plans commercial activity or develops a relevant customer segment, where the actual questionnaire and commercial evidence support that discussion.

Progress is then visible through dated actions and evidence. A milestone can be planned, under way, submitted for review or completed on an agreed basis. These are states of the development work, not new IDS scores. The original assessment remains unchanged until a later actual assessment is recorded.

U; W pp. 25-27, 64-65; C p. 6

IDS / EXPLORE

Begin with the dealer's own profile

Make the original assessment understandable before asking anyone to select a project.

Section view

Locate relevant topics in the actual questionnaire.

Question view

Read the wording, recorded answer and available date.

Development view

Choose an objective and keep progress separate from scores.

Illustrative design / independent requirements and outputs.

The profile should show the actual questionnaire version, section, question and recorded answer. A recorded date or round identifies the assessment; an import date must not be substituted for a missing assessment date. Unanswered, not applicable and not supplied remain distinct states.

A section view helps a dealer locate topics worth examining. A question view retains the detail that explains the section. Where a comparison group is appropriate and permitted, it must use a compatible questionnaire and a defined population. The comparison provides context, not a distributor audit or a ranking of personal competence.

The dealer should be able to bookmark a relevant topic, add a clarification and nominate a development ambition. That preserves the distinction between what the assessment recorded and what the dealer now intends to do.

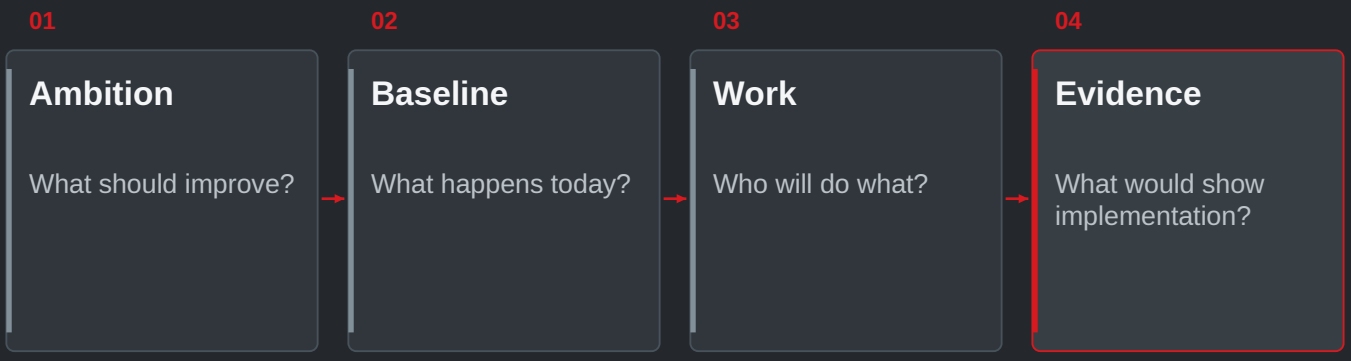

The interactive showcase demonstrates the development behaviour using an explicitly illustrative project. It does not invent a dealer score, question response or historical improvement. A production profile would use the authorised actual assessment and validated dealer relationship.

W pp. 25-27, 49, 56-57; P

IDS / CHOOSE

Choose a meaningful business ambition

The project should describe what becomes better for the dealer, not just which box will be completed.

Proposed sequence / each stage retains its own evidence and decision.

A useful ambition is concrete enough to review. For example, a dealer may want a more deliberate parts-range review or a repeatable process for planning a selected commercial initiative. The aim is to improve a practice that matters to the business, not simply generate activity against every assessment question.

The dealer and distributor identify the starting position, the work required and the evidence that would show implementation. They also identify any assistance expected from ISZE or another function. A project waiting for that assistance should remain distinguishable from a dealer project that has not progressed.

The plan should be proportionate. A short project can have a small number of meaningful milestones; it does not need a universal complexity score or a mandatory financial claim. A more substantial development proposal may include resources, investment and an explicit review of its commercial rationale.

The return to the dealer is a visible, manageable development plan. The return to the distributor is a better basis for directing its own network-development effort. ISZE can learn which tools or supporting material are useful without automatically receiving every private detail of the dealership.

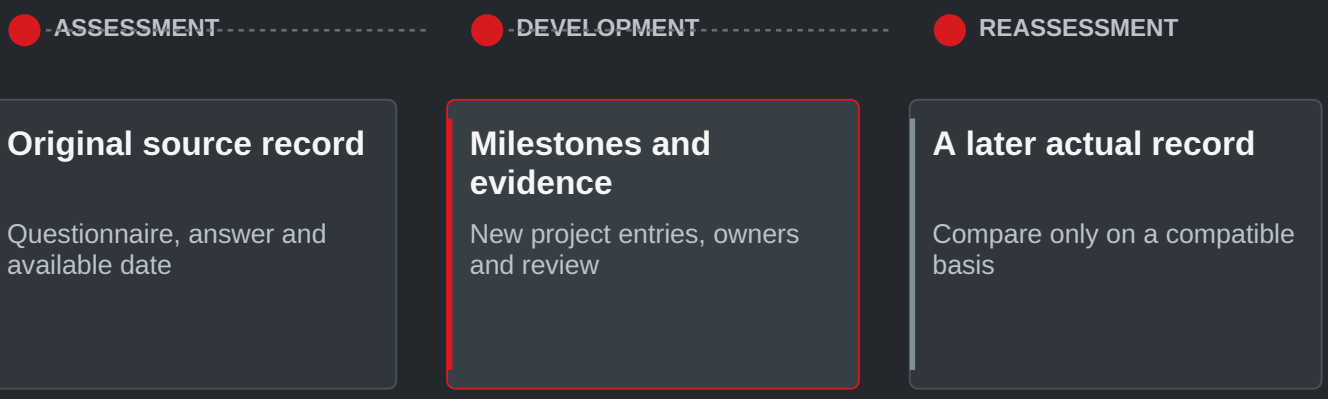

U; W pp. 26, 43-46; P

IDS / PROGRESS

Three records tell three different stories

Keep the starting assessment, project progress and later reassessment visible beside one another.

The first record is the original assessment. It describes what the dealer reported on the stated questionnaire and available date. The second is the development project: agreed work, owner, milestone, evidence and review. The third is a later assessment, if one actually takes place on a compatible basis.

Illustrative record structure / no actual dealer scores, dates or progress are represented.

The interface should allow the user to move along the development timeline and inspect each recorded change. Completing a milestone can advance project progress. It does not amend the original answer, raise an assessment score or prove a commercial outcome.

A later reassessment can add new evidence. Comparison is useful only where the questionnaire, scoring basis and relevant population are compatible. Where they are not, the tool can still show both records accurately without presenting a misleading trend.

This separation makes progress credible. A dealer can demonstrate implemented work before another assessment round exists, and an incomplete project can remain visible without erasing the value of the original assessment.

W pp. 25-27, 64-65; P

IDS / INTERACTIVE EXAMPLE

See the work move, not the score

An illustrative project shows the interaction without claiming a real dealer result.

IDS DEVELOPMENT / Establish a regular parts-range review

Objective	Method	Trial	Review
Define	Prepare	Use	Evaluate
Not started	Not started	Not started	Not started

Original assessment Not connected in this illustration

Progress entries and evidence remain separate from later reassessment.

Interface illustration / unassigned demonstration project; original assessment unchanged.

Consider a proposed project called "Establish a regular parts-range review". The dealer and distributor first agree the objective and starting position. They then prepare a repeatable review method, test it on a selected range and review the evidence of use. These milestone names are a design illustration, not copied IDS questionnaire items.

The user can record a milestone state, date and evidence note, then inspect the resulting timeline. A completed state should identify what was completed and how it was reviewed. A change or deferral records its reason rather than simply resetting the progress view.

The original assessment appears as a separate source panel. Where no actual assessment has been connected, the panel says so. Later reassessment remains unavailable until a real record exists. Project completion and business benefit are evaluated separately.

The showcase stores only this demonstration record locally in the browser, where storage is available, and offers an export. It is not a company project register or evidence that a dealer has implemented the example.

U; P; W pp. 26, 64-65

IDS / COMMERCIAL CONTEXT

Use commercial evidence where it helps

A purchasing pattern can sharpen the discussion without becoming an explanation of the assessment.

Assessment

A recorded statement of practice.

Commercial observation

A separate period, source and account basis.

Development question

Relevant context, not proof of causation.

Illustrative design / independent requirements and outputs.

A dealer-development conversation can be more useful when it includes an appropriate commercial observation. A range review may examine the composition of recorded purchasing. A commercial-planning project may use a selected campaign baseline. The observation should retain its own period and transaction meaning.

The link requires a validated relationship between the source account and the assessment. A country name, similar dealer name or submission group is not sufficient. When the relationship is unresolved, the sources can remain available separately rather than be forced into a combined judgement.

An assessment answer does not establish why purchasing changed. A strong self-assessment and a low measured spend per vehicle can concern different populations, definitions and time periods. The value of the connection is a better development question, not a causal verdict.

The dealer should see the original wording and be able to correct the interpretation. That can improve both the commercial review and the relevance of the selected project. A correction that reduces the apparent problem is useful information.

W pp. 26, 49-51, 56-57; C p. 8

IDS / SUPPORTING DEVELOPMENT

Direct assistance to a defined improvement

The project can make a case for support without turning participation into a competition for funding.

A dealer may need a specific resource to complete an agreed development project: relevant analytical guidance, a product-learning resource or a bounded improvement activity. The project record can identify that need, the expected deliverable and the role that would provide it.

Dealer	Distributor	ISZE / specialist
Owns the selected development work.	Reviews relevance and its own contribution.	Provides the specific assistance actually agreed.

Illustrative design / independent requirements and outputs.

Any co-investment proposal should state its cost basis, eligible work, recipient and approval route. A proposed allocation is not a payment commitment. A project should not gain standing by submitting more sensitive information, reporting an inflated score or claiming an unsupported sales improvement.

ISZE and the distributor should distinguish their own commitments from the dealer's milestones. The interface can show that an input has been requested, confirmed or delivered without declaring the whole project complete. This helps the participant see what it controls and what it is waiting for.

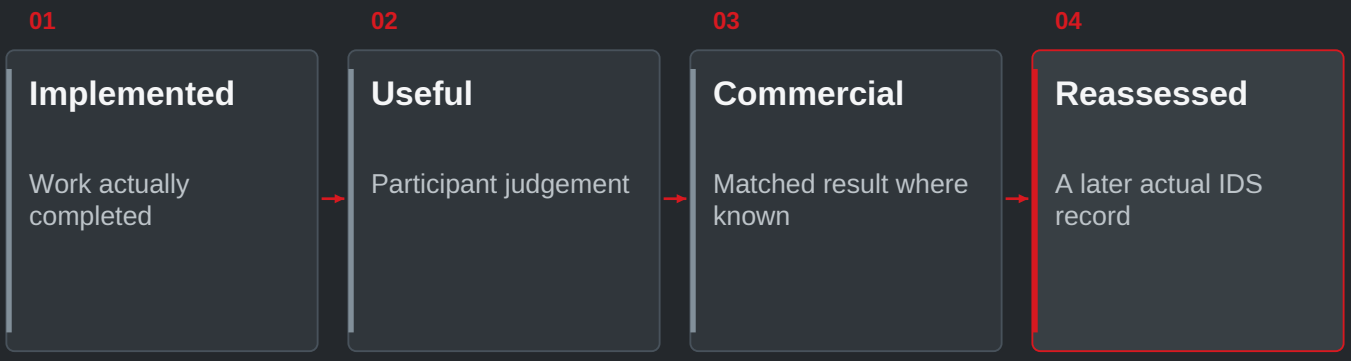

The purpose is to direct limited development effort towards meaningful work. A project can also proceed without financial assistance, using the tools and knowledge already available. The application should support that route as a normal option.

C pp. 19-20, 31; W pp. 26, 39-44; P

IDS / EVALUATE

Measure implementation and usefulness separately

Visible progress is valuable only when the work and its practical effect can be explained.

Proposed sequence / each stage retains its own evidence and decision.

A project record should distinguish the activity completed, the evidence reviewed, the participant's judgement of usefulness and any measured commercial result. A completed review method is evidence of implementation. It is not automatically evidence that sales or margin improved.

Where a commercial outcome is evaluated, preserve a defined starting position and a compatible later observation. Consider changes in product mix, market conditions, account scope and other initiatives. A before-and-after movement can be reported without claiming the project caused all of it.

Useful measures include whether the dealer can repeat the practice, whether it uses the tool again for relevant work and whether the proposed support removed an actual obstacle. A participant with no eligible project at a particular time should not be labelled inactive.

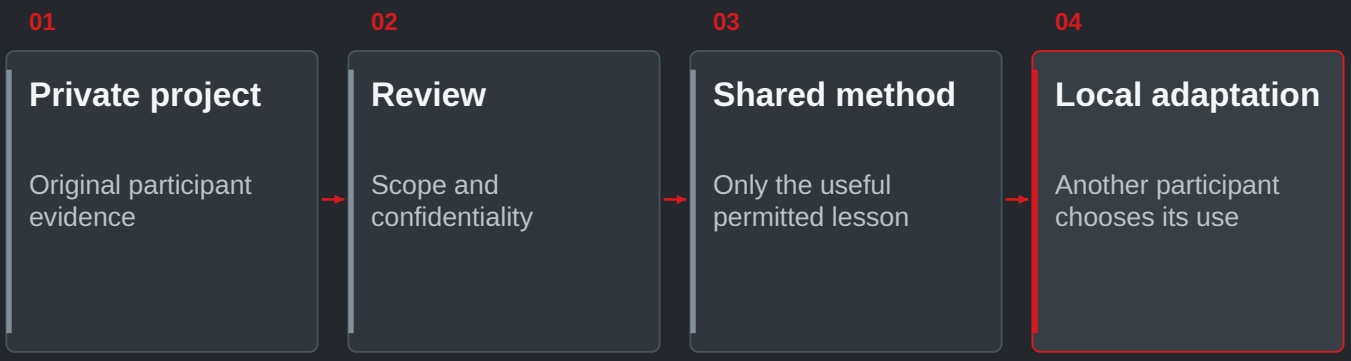

A later IDS round contributes a separate reassessment. The programme should compare compatible questions and retain differences in method or coverage. This keeps the assessment credible while allowing the development application to show progress between rounds.

W pp. 26, 43-44, 67-68; P

IDS / LEARNING

Let useful practice travel through reviewed examples

The method can become reusable without sharing a dealer's private project record.

Proposed sequence / each stage retains its own evidence and decision.

An implemented project may contain a lesson worth sharing: a clearer review method, a useful product comparison or an effective way to organise a commercial initiative. ISZE and the distributor can prepare a reviewed example describing its purpose, conditions, effort and evidence.

The shared example should contain only the information required to understand the method. Private comments, detailed financial terms and sensitive business circumstances remain in the original project. The contributor can correct the account and decide whether an identifiable example may be published.

Recognition can acknowledge a useful correction, an implemented improvement or a transferable method. It should not become a public league table based on turnover, uploaded records or self-assessment scores. A dealer can decline publicity without losing access to the useful tools.

This creates a controlled learning mechanism. One participant's experience improves the resources available to another, while the distributor relationship and original confidentiality remain intact.

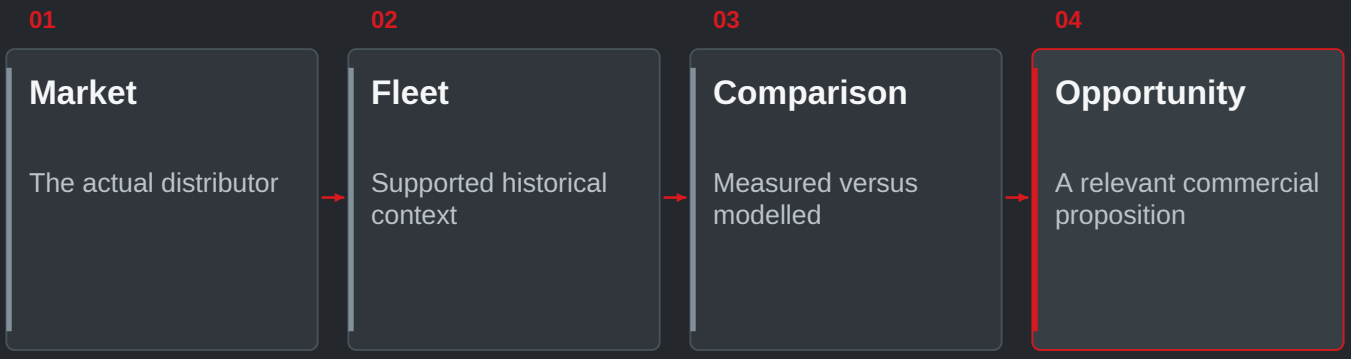

U; C p. 20; W pp. 31, 44-46

PRISM / MARKET CONTEXT

Put the parts business in its market

Historical fleets and supported commercial comparisons help identify which opportunities deserve attention.

PRISM supplies a wider view around the product and purchasing analysis. Relevant historical fleet structure, spend per vehicle and explicitly modelled service expectations can help a distributor understand the scale and character of its market. Sourced tender opportunities add a possible route to new business.

Proposed sequence / each stage retains its own evidence and decision.

The useful question is not simply which market has the largest number. It is which comparison fits the commercial decision. A different vehicle mix, reporting period or source definition can change the interpretation of an apparent shortfall. A national average can conceal the product or account issue that matters.

The application should retain the actual distributor identity. ITUK and IUK are different UK businesses; UMI and UTI are different Israeli businesses. Country aggregation must not silently combine their fleets or purchasing behaviour.

PRISM can inform a tender or a Deal of the Day, but it does not have to participate in every initiative. The connection is justified when relevant market context changes the product selection, commercial rationale or evaluation.

N; O; C pp. 6, 8; W pp. 28-30, 50-51

PRISM / FLEET STRUCTURE

A fleet is a defined population

Choose the vehicle basis before interpreting a rate or modelling a proposition.

Historical market fleet

Context on a stated market, date and method.

Eligible population

The vehicles supported by the selected application evidence.

Dealer population

Only where established; never allocated from a national total.

Illustrative design / independent requirements and outputs.

Historical fleet information is useful when its market, vehicle classes, date and method are known. It can describe the setting for a range study or provide an eligible population for a model where technical applicability is established. A contextual market total does not become the fleet for every part in that market.

The same discipline applies at dealer level. National vehicles should not be allocated among dealers by sales, geography or workshop visits to create a rate. A vehicle observed at a workshop is evidence about that observation, not proof of exclusive service responsibility.

The supplied fleet projection beyond 2025 is not a usable forecasting basis. This paper therefore does not extend the historical fleet into a future market-size chart. A future tender can instead use its own documented vehicle scope, with provisional quantities clearly identified as requirements or assumptions.

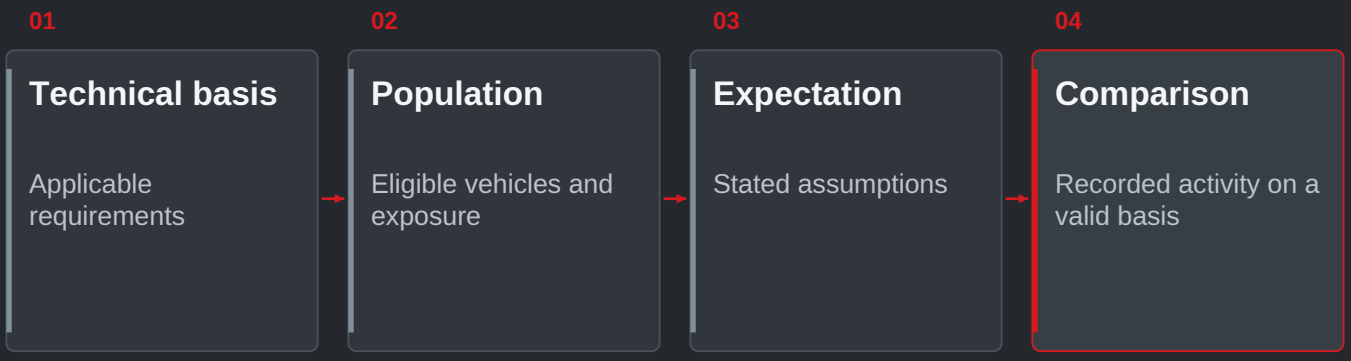

A fleet view should help the participant ask a better commercial question: which application, vehicle segment or usage profile matters for the proposed offer? The strength of the answer depends on the definition of that population, not on the visual detail of a map.

N sections 2, 11-12; O section 6.2; W pp. 28, 50-51

PRISM / EXPECTED SERVICE

Separate observed activity from expected demand

A maintenance-based comparison is useful when the technical basis and exposure are explicit.

Proposed sequence / each stage retains its own evidence and decision.

An expected service requirement combines an applicable technical schedule, the relevant vehicle population, exposure and stated assumptions. Recorded parts purchasing is a different observation. Comparing them can be useful, but only on compatible definitions and with shared-applicability parts treated correctly.

A part used across several classes should remain shared unless exclusive applicability is established. Repeating a market total against several class expectations does not create measured class-level service coverage. The same actual must not be added more than once.

For a selected fleet proposition, the model should identify the contract duration, usage basis and relevant service requirements. Observed usage may improve the assumptions. Warranty claims alone do not describe scheduled maintenance and cannot establish how often a service part should be replaced.

The output should make sensitivity visible. If the result depends on mileage, duty cycle or component quantities, the user should see how those assumptions affect it. That is a more credible commercial argument than a precise-looking figure whose technical foundation remains hidden.

W pp. 28-29, 50-51; N; O; P

PRISM / OPPORTUNITY

From a market observation to a commercial proposition

The opportunity becomes actionable when a participant chooses a specific ambition.

A sourced tender, an identified fleet segment or a product-range study can justify a closer commercial review. The relevant distributor decides whether the opportunity fits its market and capabilities. Universe can help assemble the parts and vehicle context that make that decision more informed.

Proposed sequence / each stage retains its own evidence and decision.

The commercial proposition should identify the business sought, the requirements that matter, the offer that could meet them and the unresolved assumptions. For a tender, the public notice is only one source. The actual bid requirements, local customer understanding and intended support must be established separately.

The programme is designed to improve the quality of the proposal, not maximise notice counts. An opportunity with an unknown value is not assigned a fictional revenue amount. A decision not to pursue can be valuable if the application helps the distributor identify poor fit early.

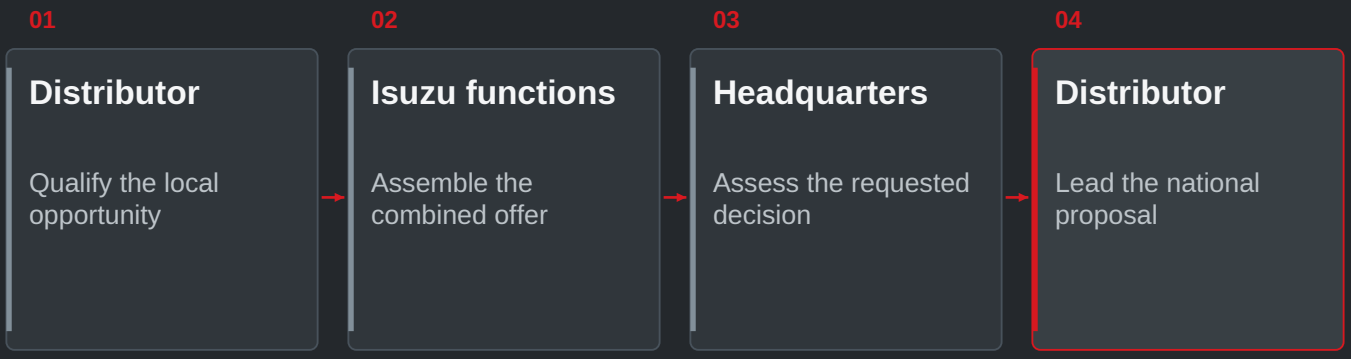

The next chapter develops the collaboration that sits beyond opportunity detection: a practical framework for the relevant Isuzu entities to assemble a proposition and request a headquarters decision.

U; W pp. 29-30; O section 1; P

APPLICATION EXAMPLE / TENDERS

Bring the relevant Isuzu entities around one opportunity

The value is a stronger joint proposition and a clearer basis for headquarters support.

Proposed sequence / each stage retains its own evidence and decision.

The lead distributor can use a shared, restricted tender framework to define the opportunity, the intended vehicle and aftersales offer, the participating Isuzu functions and the specific support needed. PRISM contributes relevant market context; AIM contributes the parts structure; the vehicle and technical functions contribute their own evidence.

The framework turns a local request into a decision-ready commercial proposal. It should explain why the opportunity is relevant, what could make the offer competitive, what each party intends to contribute and which decisions are required by which dates. A complete proposal is not an approval; it makes the approval question clearer.

The distributor retains the national bid and customer relationship. The collaboration includes only the relevant entities and permitted material. Another distributor does not gain visibility merely because it participates elsewhere in Universe.

This application can begin as a structured proposal and evidence record. It does not require a new tender collector or an automated submission service. The practical contribution is coordination of the commercial case across vehicle, parts and manufacturer responsibilities.

U; business context section 1; W pp. 29-30; P

TENDERS / RESPONSIBILITIES

A common proposal does not merge responsibilities

Each function confirms the part of the offer it has authority to provide.

The distributor qualifies the local opportunity, owns the national commercial relationship and confirms the intended bid. Isuzu Motors International Europe (IMIE), where relevant, contributes the European vehicle-sales perspective. ISZE contributes parts-business analysis and any parts support within its remit.

Isuzu Motors Limited (IML) or the relevant manufacturer/source function may be needed for technical, product, supply-capacity or commercial decisions beyond regional authority. The actual participants depend on the opportunity; the framework should not presume a universal headquarters committee.

Each contribution has a defined owner, evidence and decision state. A vehicle commitment cannot be inferred from a parts analysis. A technical confirmation is not a financial concession. One function's agreement should not automatically display the whole proposal as approved.

Participant	Contribution to the selected proposal
Lead distributor	Local requirements, commercial intent, bid ownership and customer relationship.
Vehicle-sales function	Vehicle offer, relevant product positioning and decisions within its authority.
ISZE parts function	Parts scope, supported analysis and proposed aftersales contribution.
Manufacturer / headquarters	Selected technical, product or support decisions requiring its authority.

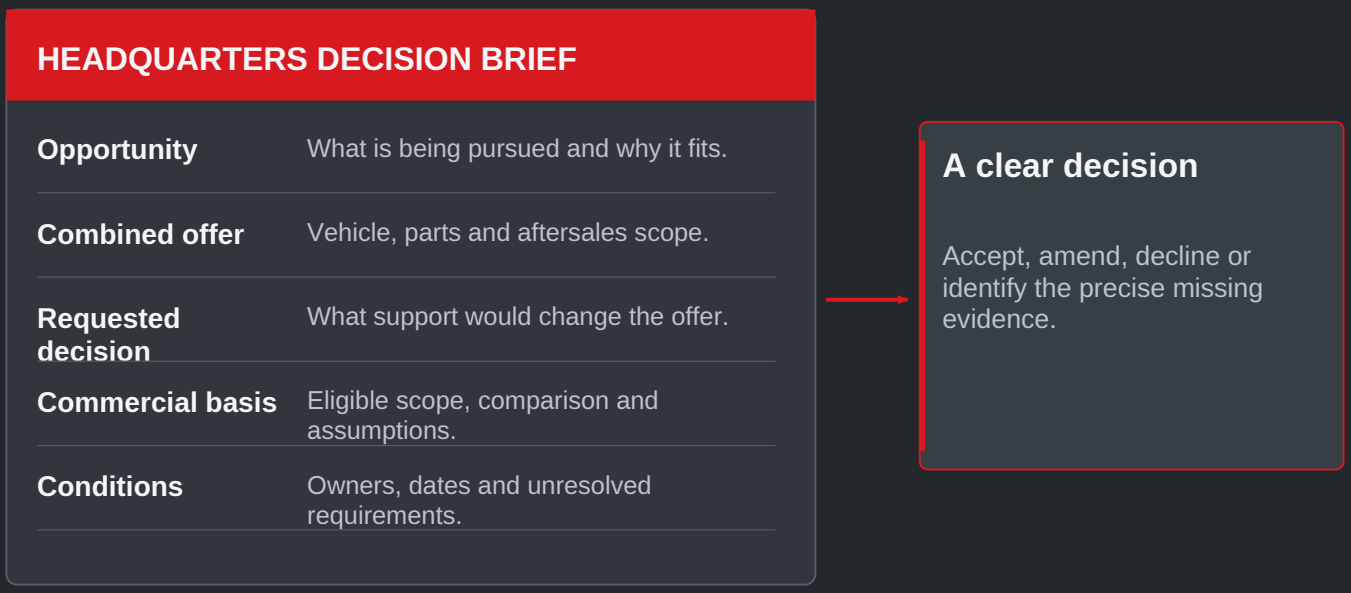

Business context, 19 Sep 2026, section 1; U; P

TENDERS / HEADQUARTERS CASE

Make the requested decision unmistakable

A headquarters brief should lead with the opportunity and the specific support that would change the offer.

The opening of the brief should identify the lead market, the actual tender or fleet opportunity, its documented requirements and the decision requested. It should distinguish what is known, what is proposed and what remains dependent on another function.

Proposed design / relationships, not measured effects.

The commercial section explains the intended offer and the reason for support. It can show the eligible scope, relevant economics and alternatives, including a proposal without additional support. Vehicle revenue, parts revenue and a tender's total advertised value must remain separate concepts.

The supporting section identifies the responsibilities, material deadlines, conditions and evidence. The requested response might be a technical confirmation, defined product contribution or a financial-support decision. It should be specific enough for the appropriate authority to accept, amend or decline.

The benefit is not a longer document. It is less reconstruction between functions and a clearer discussion of the trade-off. The same evidence can remain available behind a concise decision summary.

U; W pp. 29-30, 36-39; P

TENDERS / READINESS

Show what is ready for a decision

Readiness should be explained by requirements, not compressed into an artificial score.

Requirements Confirm in the actual proposal	**Lead distributor** Confirm in the actual proposal	**Relevant functions** Confirm in the actual proposal
Eligible scope Confirm in the actual proposal	**Requested support** Confirm in the actual proposal	**Decision deadline** Confirm in the actual proposal

Prepared for review

Support, submission and award are separate states.

Illustrative preparation checklist / completeness is not approval or probability of award.

The framework can show separate evidence checks: opportunity requirements identified, lead distributor confirmed, relevant functions assigned, eligible offer scope described, commercial assumptions stated and requested support defined. A missing item identifies the decision it prevents and the role that can resolve it.

These checks do not establish the likelihood of winning. They describe the preparation of the proposal. A complete set can make a proposal ready for review while approval and award remain unknown.

The interactive example lets a user work through a fictional preparation checklist. It can distinguish an incomplete preparation from a complete draft. It cannot produce an approval, grant access to headquarters or claim that a real tender has been accepted.

The operating version would retain actual documents, accountable owners and source dates. Changes to requirements or deadlines would be versioned so that each function can see whether the proposal it reviewed is still the one being pursued.

P; U; W pp. 29-30; R pp. 7-8

TENDERS / SUPPORT ECONOMICS

Explain what support would buy

Support should be assessed against a defined commercial proposition, not an assumed share of a notice value.

Requested

Eligible support and its commercial purpose.

Approved

The actual decision, terms and authority.

Observed

Award and related parts business on their own evidence.

Illustrative design / independent requirements and outputs.

The proposal should identify the eligible parts or activities, proposed terms, relevant period and beneficiary. The financial comparison uses the same scope for the unchanged and supported offer. Any forecast quantity must be identified as a requirement, commitment or scenario rather than measured demand.

ISZE parts gross profit can be compared using the documented net selling-price and parts purchase-cost basis. Other support and programme costs should be shown separately when assessing contribution. A payment or concession is not automatically incremental network profit; it is a cost to one party and a benefit to another.

The manufacturer decision may also have a strategic rationale that is not reducible to a single short-term parts calculation. That rationale should be stated rather than hidden inside an exaggerated return. The proposal should identify which parts of the case are measured, modelled or a commercial judgement.

After the decision, the framework preserves the approved scope and conditions. A later award, order or billing event is recorded separately. No part of the proposal becomes realised revenue simply because support was approved.

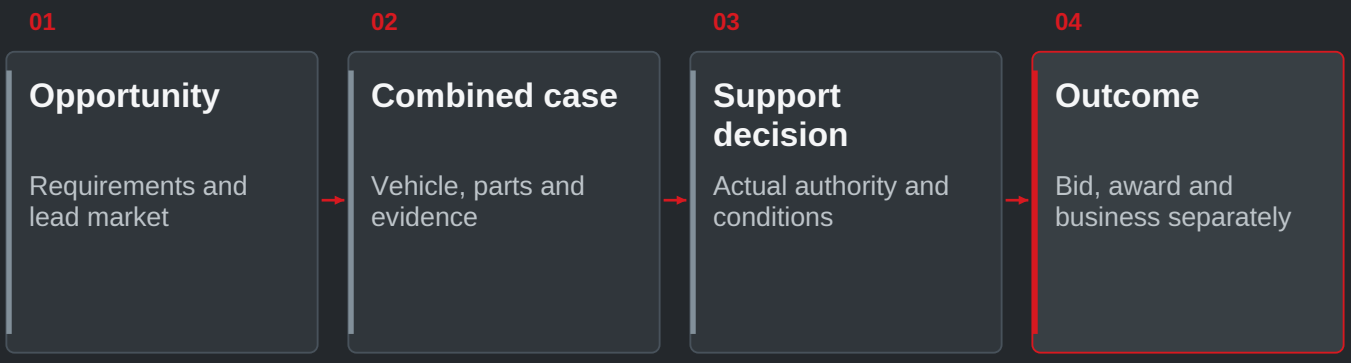

AIM v0.3 calculation rules; W pp. 29-30, 36-39; P

TENDERS / COMPLETE EXAMPLE

From a local ambition to a joint proposal

Illustrative journey: an unassigned fleet tender, with no actual value, customer or award implied.

The distributor identifies a relevant opportunity and confirms an intention to investigate. It records the source requirements and the open questions. PRISM adds the supported market context, while the vehicle function describes the possible vehicle offer and ISZE identifies the relevant parts scope.

Proposed sequence / each stage retains its own evidence and decision.

The participating functions review the intended proposition together. The distributor explains the local competitive challenge; the Isuzu functions identify which contributions are possible within their authority and which require headquarters review. The proposal retains an unchanged-offer alternative so that the requested support has a clear comparison.

A concise headquarters brief then states the requested decision, supporting evidence, conditions and deadline. The response may confirm a contribution, amend the scope or decline the request. The distributor decides how to proceed with the actual bid through its existing route.

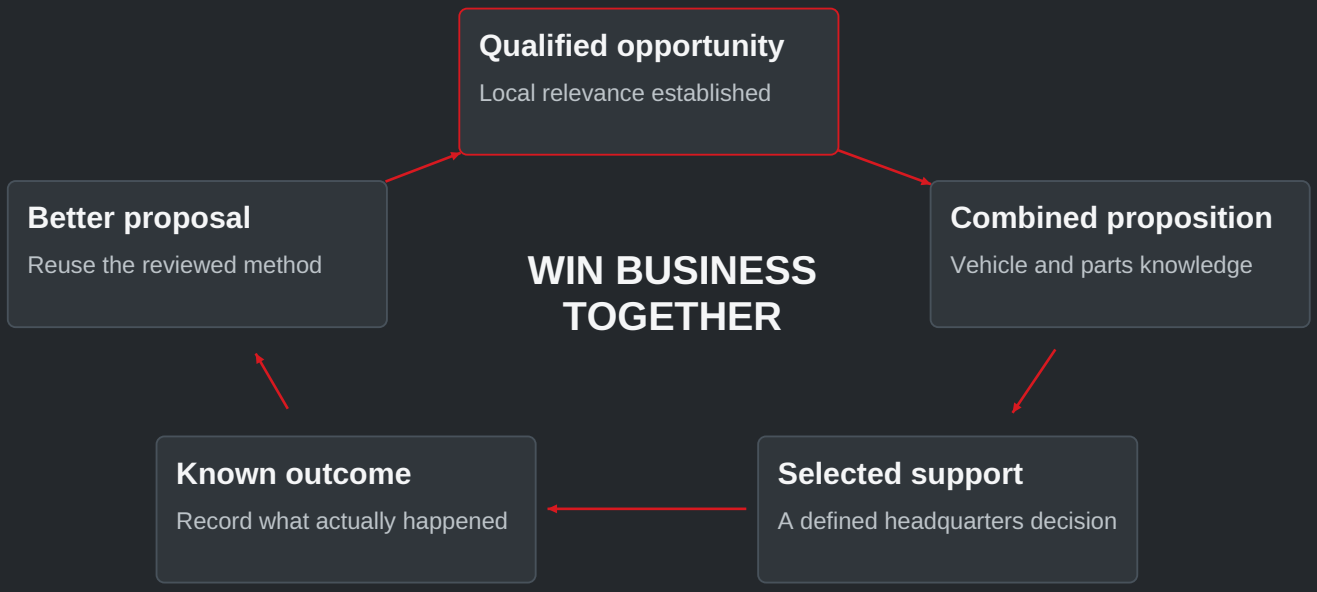

The record later distinguishes the submitted bid, known award result and any documented related business. A reviewed lesson may improve the next proposal without distributing the original bid evidence to other distributors.

U; P; W pp. 29-31

TENDERS / REPEATABLE VALUE

Each opportunity should improve the next proposal

The reusable asset is a clearer method and better evidence, not unrestricted access to previous bids.

Proposed feedback mechanism / no measured causal effect is implied.

The programme can learn which requirements repeatedly create difficulty, which evidence headquarters needs and which contributions proved useful. The resulting improvement may be a better proposal template, clearer technical reference or a more realistic commercial assumption.

Learning should include opportunities not pursued and support not approved, as well as awarded tenders. A reasoned decision can prevent wasted effort. A reported reason for losing remains attributed unless the evidence supports a stronger conclusion.

The record should keep the preparation effort, quality of the decision and commercial outcome distinct. Less preparation time can be useful even when the tender is not won. An award can occur for reasons unrelated to the framework. The programme should avoid selecting only favourable outcomes when evaluating its usefulness.

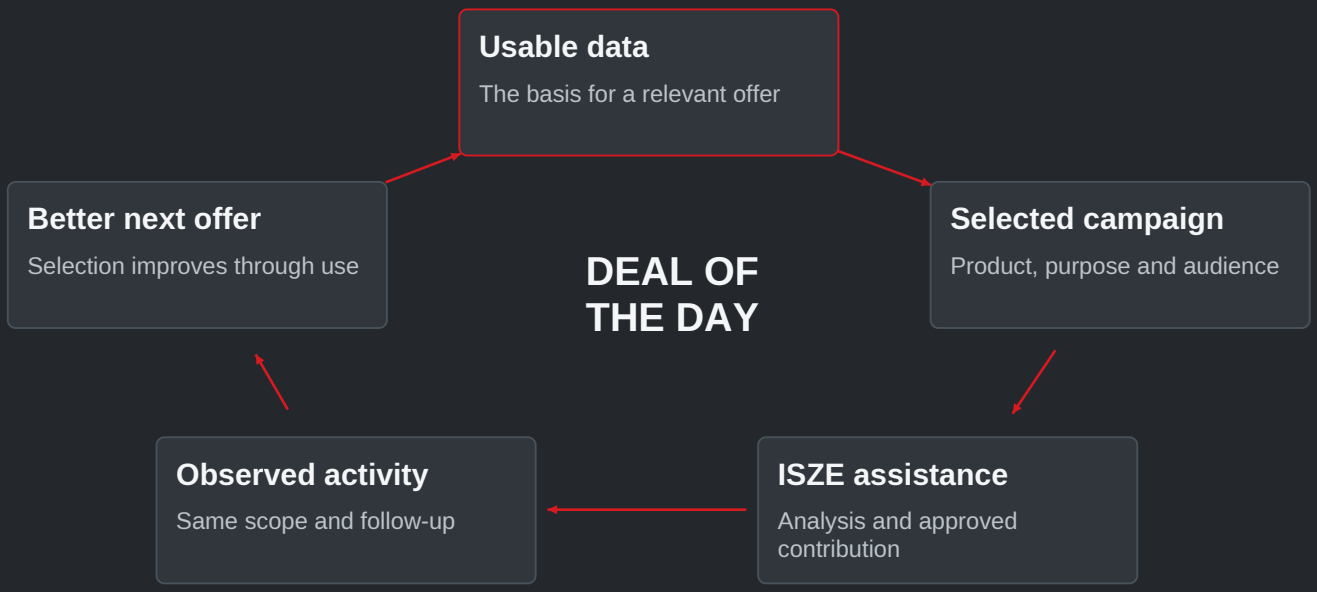

The positive dynamic is a distributor bringing a qualified opportunity, Isuzu contributing a stronger combined proposition and the experience improving the next opportunity. That is a collaboration mechanism worth testing in its own right.

U; W pp. 30-31, 43-44, 67-68; P

APPLICATION EXAMPLE / DEAL OF THE DAY

Make the next offer more relevant

Use good commercial information to select the product, audience, timing and level of assistance.

Proposed feedback mechanism / no measured causal effect is implied.

Deal of the Day is a proposed application through which ISZE can help a distributor prepare a specific, time-limited commercial offer. The distinctive value is the preparation behind it: a reasoned product selection, relevant audience, transparent economics and a way to learn from what follows.

The distributor's usable data makes this assistance more precise. Purchasing history can help identify relevant ranges and account patterns. Campaign information can show what was offered, when and to whom. A later compatible observation can help evaluate whether the activity was useful.

ISZE's contribution could include product analysis, audience-selection support, approved product material and a bounded commercial-support proposal. Financial assistance remains a separate decision based on the eligible campaign and its economics. Providing data does not automatically create a discount entitlement.

The application is a concrete example within a broader Universe, not a commitment to issue a promotion every day. The name describes a possible offer format. The operating cadence should follow relevance, preparation capacity and the distributor's commercial plan.

U; P; AIM v0.3 scenario rules

DEAL OF THE DAY / OBJECTIVE

Choose the commercial purpose first

A promotion should have a reason beyond generating an order before the deadline.

A proposed offer might introduce an eligible range to relevant accounts, develop repeat purchasing in a selected product group or test a better-composed Genuine/BVP proposition. A clearance objective is another possible purpose, but it needs actual stock evidence and should be identified as such rather than presented as market development.

Develop a range

Relevant introduction and later repeat use.

Strengthen activity

A defined account or product objective.

Test the offer

A transparent experiment with a preserved baseline.

Illustrative design / independent requirements and outputs.

The objective determines the audience and evaluation. A range-introduction test should observe whether relevant accounts start and continue purchasing. A repeat-purchasing initiative should use a meaningful pre-offer baseline. A clearance exercise should examine the stock and contribution outcome on its own basis.

The distributor should be able to compare alternative approaches. A product explanation or targeted range package may be more appropriate than a price reduction. Where a discount is proposed, its eligible scope and financial effect should be visible before approval.

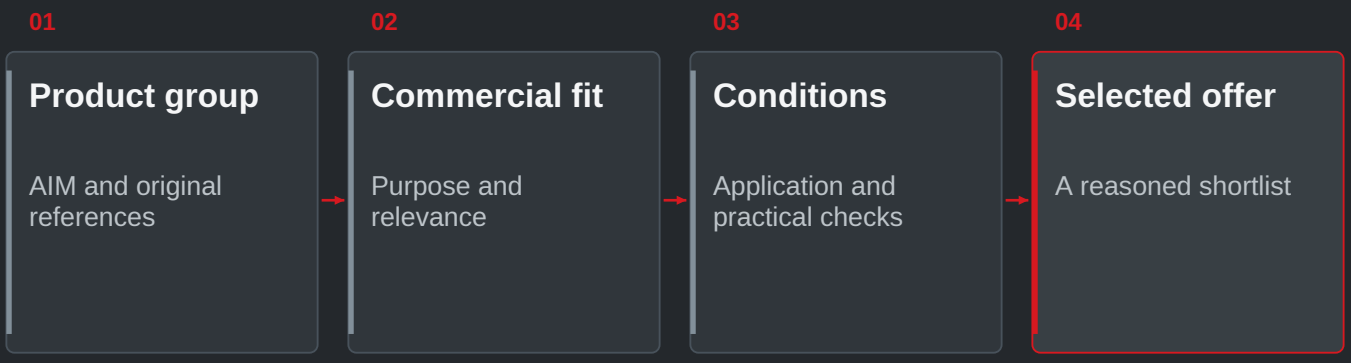

A concise objective becomes the reference for all subsequent decisions: which parts qualify, what information is needed, what ISZE can contribute and which later observations would count as success.

U; P; C pp. 9, 13, 27; W pp. 36-39

DEAL OF THE DAY / PRODUCT SELECTION

Turn the Atlas into a selection tool

Show why a product is a candidate and what would make it unsuitable.

Proposed sequence / each stage retains its own evidence and decision.

The distributor starts with an AIM product group or a selected set of original references. The Atlas shows the covered purchasing pattern, product composition and relevant Genuine/BVP relationships. The candidate list should explain its selection rather than rely on a universal opportunity score.

A candidate could have a relevant application, an established purchasing base and a specific development objective. Another could require a product-content comparison before it is suitable for promotion. An unexplained purchasing decline alone is not a sufficient reason to discount.

The selected offer needs a technically supported product scope and a practical fulfilment check through the existing supply process before launch. Universe can retain those confirmations as campaign conditions; it does not need to operate a parallel availability-enquiry service.

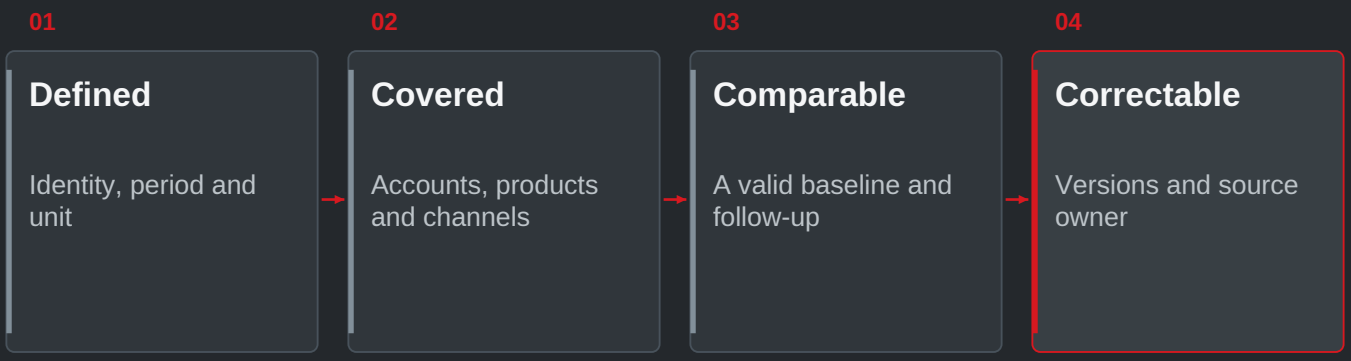

A useful selection record includes the product rationale, eligible references, relevant application evidence, planned objective and unresolved conditions. It should also retain rejected candidates and reasons where this improves the next selection.

U; P; C pp. 6, 13-14; W pp. 24-25

DEAL OF THE DAY / GOOD DATA

Good data means fit for the campaign

Use clear requirements tied to the intended analysis, not a score for how much a participant discloses.

Proposed sequence / each stage retains its own evidence and decision.

The minimum useful contribution depends on the proposed offer. For a product-level national campaign, consistent part, period and quantity information with declared coverage can support a range review. Individual account targeting additionally needs stable account identities and sufficient comparable history. Neither requires dealer resale prices by default.

Good data has an understandable transaction meaning, a clear source period, stable original product identity and a correction procedure. It distinguishes genuine zero activity from missing information. A larger file is not necessarily a better contribution, and an honest correction should improve rather than damage the participant's standing.

ISZE can explain the additional assistance that a usable contribution enables: a more precise product shortlist, supported account selection, a better scenario or a credible post-campaign review. Where the information is not sufficient, the offer preparation remains narrower or the affected analysis waits for clarification.

The campaign-specific requirements and any support conditions should be agreed before the campaign. They are not a second payment for an existing reporting obligation and do not change access to ordinary services.

U; C pp. 19, 21-22; W pp. 62-64; P

DEAL OF THE DAY / AUDIENCE

Offer something relevant to the right business

A selected account audience requires genuine account evidence, not an allocation from a national total.

The distributor can use covered account purchasing to identify businesses with a relevant range history. Depending on the objective, the selected audience may include established buyers, accounts purchasing related products or accounts participating in a specific development initiative. Each inclusion should have an explainable commercial rationale.

National source

Prepare the range and campaign framework.

Account source

Add supported account targeting where available.

Local judgement

Distributor confirms the relevant audience.

Illustrative design / independent requirements and outputs.

A missing purchase is not proof that an account needs the part. Product applicability, source coverage and local relevance must be considered before describing the selection as an opportunity. The distributor retains the final audience decision and the relationship with its dealers.

Where only national information is available, the tool can still help prepare the product selection and campaign design. The distributor may select the audience locally without sending personal customer information or pretending the national source contains individual dealer history.

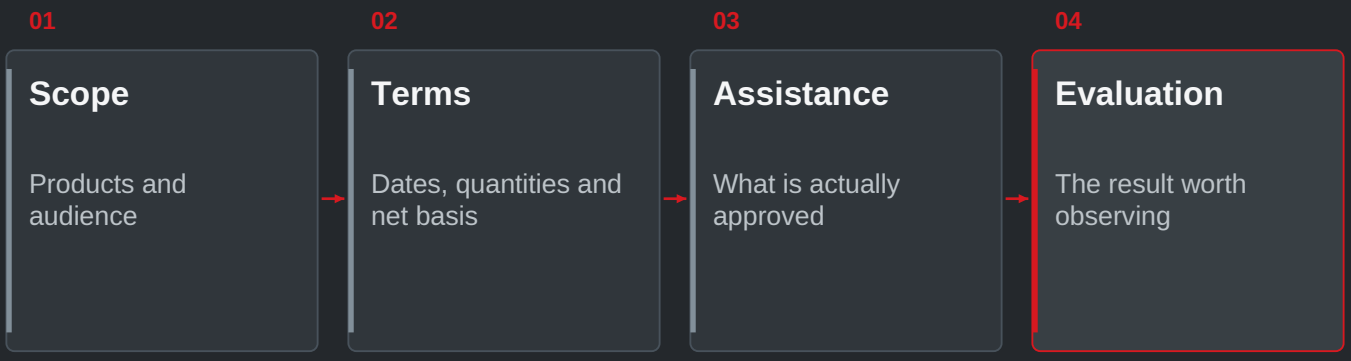

Only the authorised distributor sees its selected accounts and terms. ISZE receives the information needed for the agreed preparation and evaluation. Other distributors do not see the audience, its response or the planned offer.

C pp. 8, 21-22, 25; W pp. 49-50, 68-69; P

DEAL OF THE DAY / THE OFFER

Make the commercial proposition specific

The offer record should be clear enough to assess and simple enough for the distributor to use.

Proposed sequence / each stage retains its own evidence and decision.

The draft identifies the selected products, application and pack basis, intended audience, commercial purpose, validity period and eligible quantities. It retains the unchanged-offer comparison and the proposed net terms at the correct commercial stage. Any additional assistance is described separately.

The distributor controls its own selling proposition. ISZE can contribute a product story, factual range material and any approved terms within its authority. The tool should not prescribe dealer resale prices, assume that a concession will be passed through or reveal another participant's future prices.

A genuine time-limited offer needs real dates and conditions. The showcase should not manufacture a countdown, stock scarcity or "today only" claim. In the operating application, the offer would remain a draft until the relevant commercial and practical conditions are confirmed.

The participant should leave with a usable campaign brief: what to offer, why it was selected, what support is confirmed, how it will be presented and what will be evaluated afterwards.

U; P; W pp. 36-39, 45; AIM v0.3

DEAL OF THE DAY / ISZE CONTRIBUTION

Make the assistance visible before asking for more

The participant should understand which additional commercial capability its information enables.

Analytical assistance

Product selection, audience method and scenario.

Campaign preparation

Permitted product material and local adaptation.

Commercial contribution

A separate eligible proposal, subject to approval.

Illustrative design / independent requirements and outputs.

With a usable product history, ISZE can help prepare a product shortlist and explain the selection. With validated account-level purchasing, it can help develop a more specific audience. With a dated campaign record and a compatible later period, it can prepare a meaningful result review.

Other assistance could include selected product imagery, factual campaign material, language adaptation and a scoped support proposal. The availability of these contributions depends on accepted content, operating capacity and the particular campaign; none is an automatic entitlement created by an uploaded file.

Financial assistance should have its own commercial case: recipient, eligible references, dates, quantities, support mechanism, cost basis and approving authority. A fixed campaign contribution and a unit concession are different mechanisms. Where support is already included in the net price, it must not be deducted again in the economics.

The positive exchange is explicit: relevant information makes the offer preparation and evaluation better, and the participant receives a stronger commercial tool in return. It is not a reward for the volume of data disclosed.

U; P; C pp. 19, 21-22, 27; W pp. 36-39

DEAL OF THE DAY / ECONOMICS

Read revenue, gross profit and campaign cost together

The following example is hypothetical arithmetic, not an Isuzu offer or an expected demand response.

Unchanged offer	Proposed offer	After campaign cost
REVENUE	REVENUE	REVENUE
EUR 10,000	**EUR 11,400**	**EUR 11,400**
GROSS PROFIT	GROSS PROFIT	CONTRIBUTION
EUR 3,000	**EUR 3,000**	**EUR 2,700**
30.0% margin	26.3% margin	Contribution, not gross profit

Hypothetical / net price 100 to 95; cost 70; quantity 100 to 120; EUR 300 additional campaign cost.

Assume a comparable unchanged offer with 100 eligible units, a net unit selling price of EUR 100 and parts purchase cost of EUR 70. Revenue is EUR 10,000, gross profit EUR 3,000 and gross margin 30.0%. These are illustrative inputs only.

At a proposed net price of EUR 95 and 120 units, with the same unit cost, revenue is EUR 11,400, gross profit EUR 3,000 and gross margin 26.3%. Revenue rises but gross profit does not. The additional quantity is an assumption, not something the price reduction guarantees.

An additional EUR 300 campaign cost, assumed outside those net prices and unit costs, would reduce campaign contribution to EUR 2,700. Compared with the EUR 3,000 baseline, contribution would then be EUR 300 lower. The recipient and treatment of any support must be identified so that it is not counted twice.

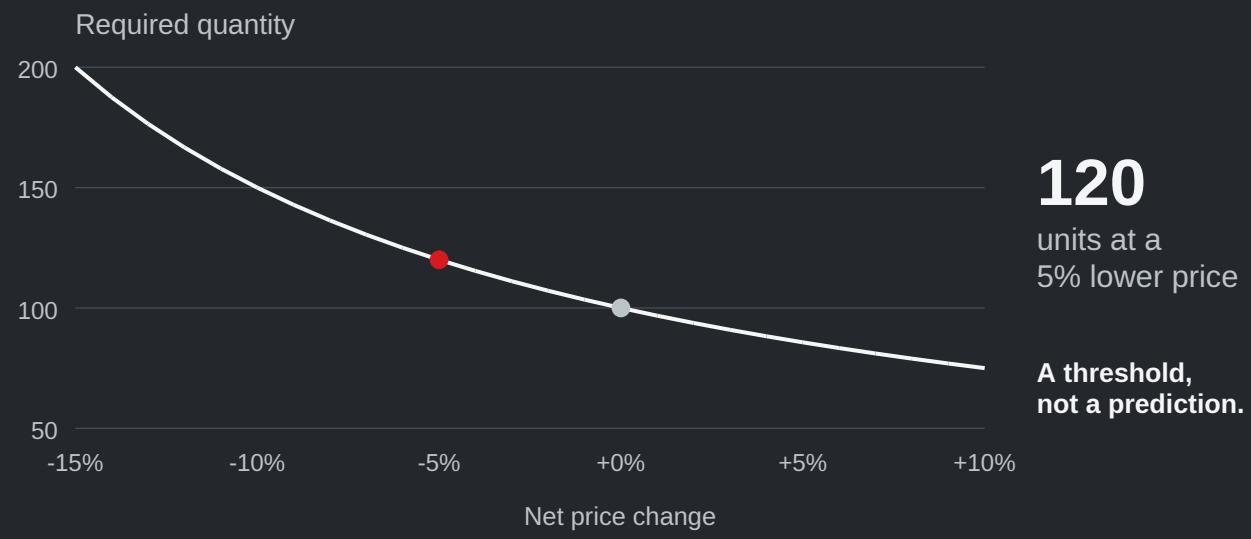

The tool should show both the result and the threshold. In this illustration, 120 units preserve gross profit; 132 units are needed to preserve the baseline contribution after the additional EUR 300 cost.

P: hypothetical inputs and arithmetic, 22 Sep 2026; AIM v0.3 measure definitions

DEAL OF THE DAY / SENSITIVITY

A threshold is more honest than a volume promise

Change the proposed price and see how much quantity would be needed to preserve the baseline.

Hypothetical mathematical threshold / baseline 100 units at EUR 100 net price, EUR 70 parts cost. No demand forecast.

For the hypothetical baseline of EUR 100 net price, EUR 70 parts purchase cost and 100 units, reducing the net price to EUR 95 reduces unit gross profit from EUR 30 to EUR 25. Preserving EUR 3,000 of baseline gross profit requires 120 units, 20% more than the baseline. No such response is assumed to occur.

The required quantity rises quickly as the proposed unit gross profit narrows. At zero or negative unit gross profit, an ordinary positive-volume break-even does not exist for a positive baseline. The tool must explain that condition rather than display infinity as a target.

A fixed campaign cost changes the threshold again. A discount applied to the existing base has a different economic effect from support confined to additional eligible units. The scenario should state which structure is being tested and keep the baseline scope unchanged.

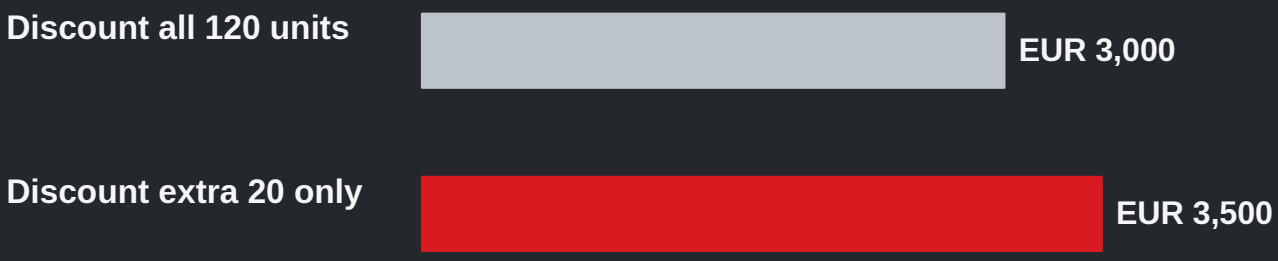

The chart is a mathematical sensitivity, not an estimated customer response curve. It is useful for deciding what evidence or commitment would be needed before taking a commercial risk.

P: hypothetical baseline EUR 100 / EUR 70 / 100 units, 22 Sep 2026; AIM v0.3

DEAL OF THE DAY / ELIGIBLE SCOPE

Protect the base while testing the opportunity

The support mechanism matters as much as the headline discount.

EUR 500 difference in gross profit from scope alone.

Hypothetical / 100 baseline units, 20 extra units, cost EUR 70. Discounted price EUR 95; original price EUR 100.

A blanket concession can reduce contribution on quantities that would have been bought anyway. A narrower structure may limit the concession to explicitly eligible additional activity, a selected account population or a bounded campaign. The right structure depends on the commercial objective and the ability to verify eligibility.

In the hypothetical example, retaining the original EUR 100 price on the 100-unit baseline and applying EUR 95 only to 20 additional units produces EUR 3,500 of gross profit before other campaign costs. Applying EUR 95 to all 120 units produces EUR 3,000. The EUR 500 difference follows from the support scope, not from a prediction about which proposal customers would accept.

An incremental-only mechanism requires a credible baseline, terms and evidence. It must not label ordinary replenishment as additional activity or reward moving purchases between periods. The programme should test the method before treating it as a standard commercial scheme.

The tool's contribution is to make these alternatives transparent. The authorised commercial decision remains with the relevant functions, using current eligible prices and documented costs.

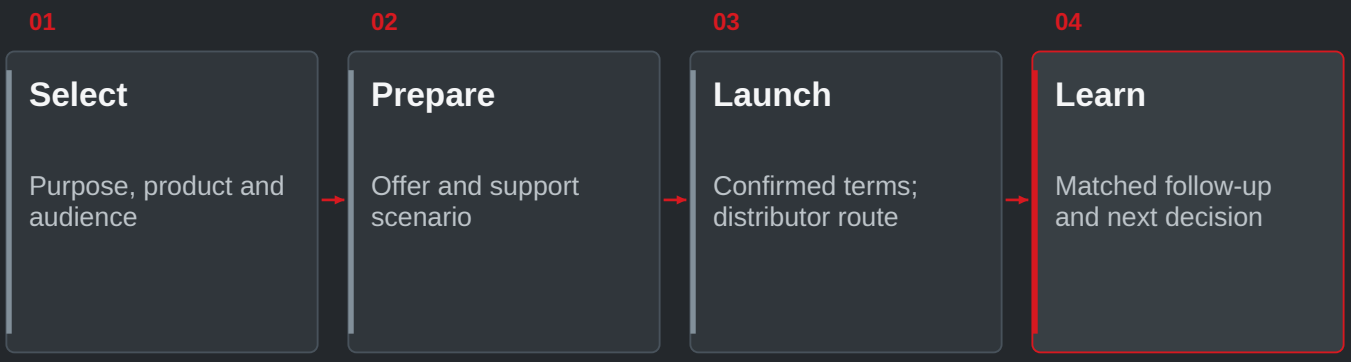

P: hypothetical comparison, 22 Sep 2026; AIM v0.3; W pp. 36-39

DEAL OF THE DAY / COMPLETE EXAMPLE

A prepared offer, not a generic promotion

Illustrative journey: select, design, approve, launch through the distributor and learn.

The distributor selects a commercial objective and a candidate product group in the Atlas. The tool carries the original references and supported history into a draft offer. The participant confirms the relevant audience locally and identifies the missing campaign-specific information.

Proposed sequence / each stage retains its own evidence and decision.

ISZE contributes the analysis and material it has agreed to provide. A proposed commercial contribution is assessed against the unchanged-offer baseline and the eligible campaign scope. Practical product and fulfilment conditions are confirmed through existing responsible functions before launch.

The distributor then launches the approved offer through its own commercial route. Universe retains the campaign identity, actual dates and agreed evaluation basis; it does not need to send orders, change prices in a transaction system or collect end-customer identities.

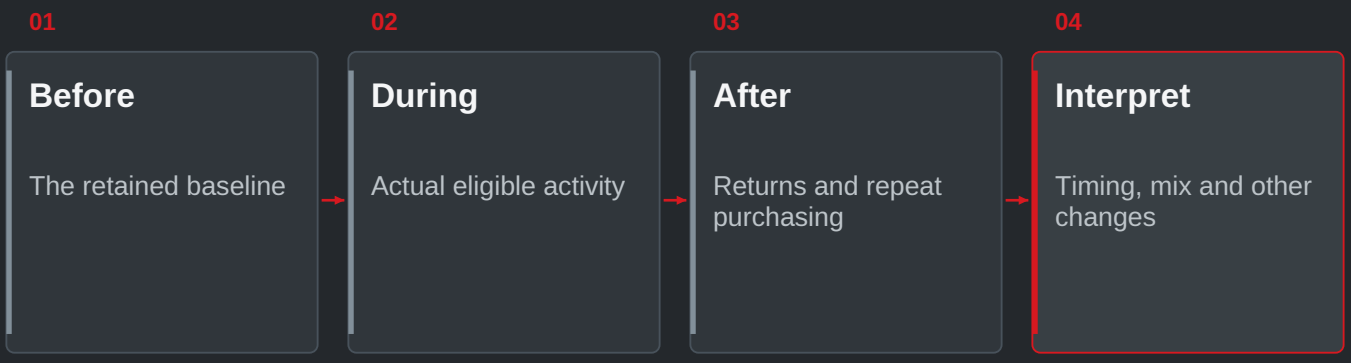

After the offer, a compatible later source supports a review of purchasing, returns and repeat activity. A meaningful observation window includes the period after the promotion so that an early order spike is not automatically counted as lasting growth.

U; P; W pp. 36-39, 43-44, 67-68

DEAL OF THE DAY / RESULT

Look beyond the order spike

Evaluate the eligible activity over a period that can reveal timing and displacement.

Proposed sequence / each stage retains its own evidence and decision.

The result review should compare the original baseline, campaign-period activity and an appropriate follow-up period. Use the same product scope and commercial stage. If the source covers sales to dealer, describe sales to dealer rather than infer retail demand.

The review should consider returns, later purchasing reductions, stock accumulation and movement between Genuine and BVP. An order placed earlier than usual may increase campaign-period billing without increasing the business over the full comparison window. A change in mix may improve or reduce contribution even when unit volume grows.

Where appropriate, a preselected comparison group or staged introduction can help separate the campaign from other changes. The method should be chosen before examining the result. A simple before-and-after comparison can still be informative if its limitations are clear.

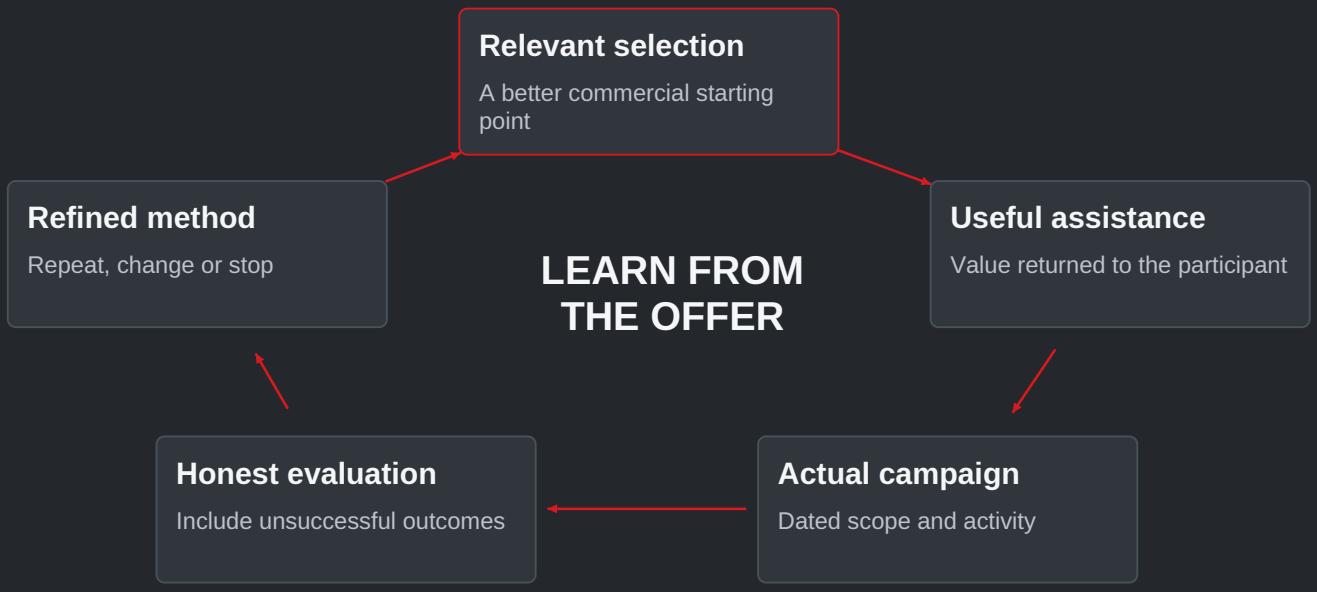

The participant should receive a practical conclusion: repeat the approach, narrow the audience, change the offer or stop. Unknown customer outcomes and incomplete follow-up remain visible rather than being converted into success.

W pp. 36-39, 43-44, 67-68; P

DEAL OF THE DAY / POSITIVE DYNAMIC

Better information should improve the next offer

The value of the exchange becomes visible through a more relevant selection and a better-informed next decision.

Proposed feedback mechanism / no measured causal effect is implied.

A usable contribution supports a selected offer. The distributor receives analysis, material or approved assistance that makes the offer more practical. The campaign leaves a dated result, allowing the participant and ISZE to improve the next selection.

The learning can be about relevance, not just discount depth. A product may appeal to a different account group, a package may need different contents or a campaign may be better timed less frequently. A disappointing result can be useful when it prevents repeating the same ineffective activity.

This is a stronger reason to contribute than an abstract promise of better visibility. The participant can see what its information changed and which benefit it received. The programme can then ask for the smallest additional context that would improve the next offer.

The operating test is continued useful participation: relevant offers prepared, decisions improved, effort understood and results reviewed. More uploads, more promotions or more daily visits are not substitutes for that test.

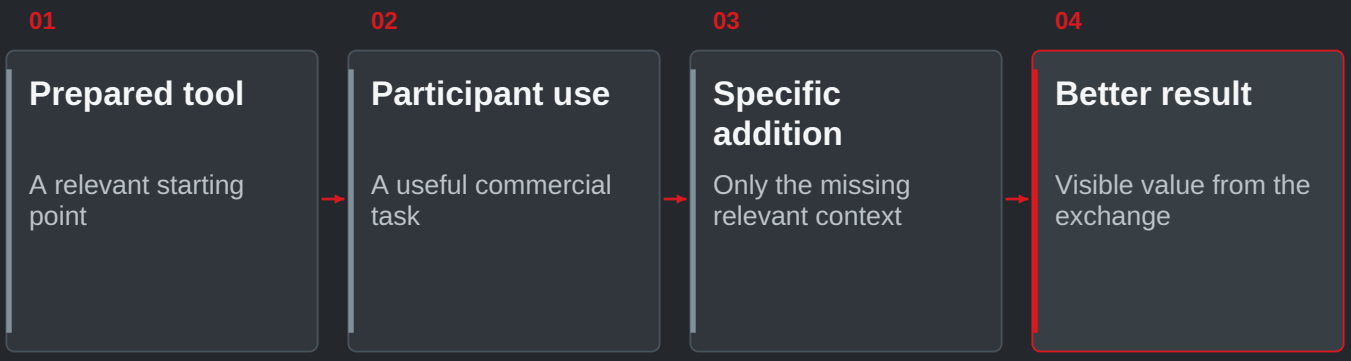

U; P; W pp. 43-44, 67-68

PARTICIPATION

Begin with value already prepared

The first experience should demonstrate the programme's usefulness before expanding the information request.

ISZE can begin with the sources already accepted for a participant. A national range review, a dealer's actual IDS profile or a selected tender framework provides a concrete entry point. The recipient should see the commercial purpose and what the tool can do at its current level of information.

Proposed sequence / each stage retains its own evidence and decision.

The next contribution is specific. It may confirm an account relationship, correct a reporting definition, add a project milestone or provide the campaign dates needed for a result review. The participant should understand which output becomes better as a result.

An effective exchange also reduces repeated preparation. Stable definitions can be agreed once, existing distributor submissions reused and only genuine exceptions returned for clarification. The person producing the information should experience that improvement directly.

The programme must observe whether the proposed benefit is sufficient. A technically successful submission does not show that a distributor or dealer values the tool. The first-use design should therefore include the participant's judgement and the total effort required.

C pp. 18, 21-22; W pp. 32-35, 43-44; P

PARTICIPATION / FIRST EXPERIENCE

Offer a useful starting point for each role

The same programme can support different entry points without creating different definitions of the business.

Parts manager

Explore a relevant product and account pattern.

Dealer principal

Choose an IDS development objective.

Commercial lead

Prepare a tender or selected offer proposition.

Illustrative design / independent requirements and outputs.

A distributor parts manager might start in the Atlas with the composition of a selected range. A dealer principal might start with an IDS development objective. A commercial lead might start with the requirements for a joint tender proposal. A campaign owner might start with the information needed to prepare a Deal of the Day.

Each entry should retain the relevant organisation, period and purpose. The participant should not have to learn an internal systems diagram before obtaining value. The whole-system showcase explains the connections; the operating tool would take the participant directly to the work it selected.

The first task should be small enough to complete but meaningful enough to judge. It should include a valid correction or incomplete source, rather than demonstrate only a perfectly prepared case. A participant should be able to decline an optional addition and still use the supported narrower tool.

The first result is evidence about that task, not proof that every market or application is ready. The next task should build on what actually worked and the information the participant found useful.

W pp. 15-19, 32-35, 43-44; P

INFORMATION EXCHANGE

Ask for the information that changes the output

Each application needs a clear contribution-and-return agreement.

The recurring purchasing exchange should retain distributor identity, original part, reporting period, quantity and unit, coverage and correction history. Account identity is required for account-specific analysis where the source supports it. The default standard does not require distributor or dealer selling prices.

Application-specific additions are narrower. Tender collaboration needs the opportunity requirements and requested decisions. IDS progress needs the agreed objective, milestone state and supporting evidence. Deal of the Day needs the selected scope, campaign dates, relevant audience basis and comparable later activity for evaluation.

The participant should see the purpose, audience and returned capability before making an optional contribution. A locally calculated aggregate may be sufficient for a financial outcome. A single project note does not imply permission for a recurring workshop or inventory export.

Application	Useful contribution	Return
Atlas	Defined purchasing history	Product composition and meaningful comparisons.
IDS progress	Objective, milestones, evidence	A visible development record and review.
Tender collaboration	Requirements and requested decisions	A coordinated headquarters proposal.
Deal of the Day	Eligible scope and campaign observations	A better-prepared offer and result review.

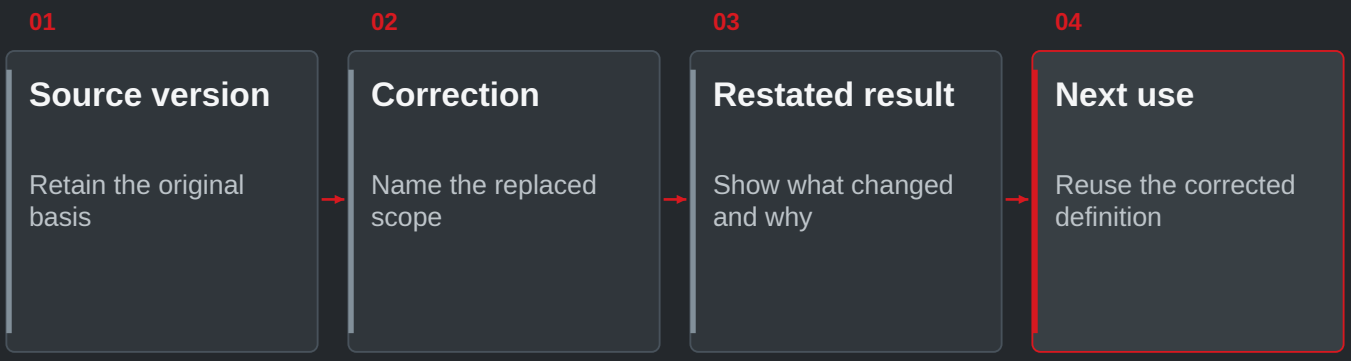

C pp. 21-22; W pp. 62-64; U; P

INFORMATION QUALITY

A correction should improve the relationship

Make it easier to provide an accurate source than a superficially complete one.

Coverage should be described in ordinary business terms: included accounts and channels, product scope, reporting period, transaction meaning and known missing periods. Wholesale inclusion, returns and corrections should be explicit. These definitions matter more than forcing every participant to use the same column names.

Proposed sequence / each stage retains its own evidence and decision.

A revised submission identifies the earlier version and scope it replaces. The two versions are not added together. Annual control totals are reconciled separately from monthly observations, and national totals are not added to the dealer detail they control.

A correction can change a commercial interpretation. The programme should show the affected results and preserve the evidence used for an earlier decision. Participants should not be asked to explain a movement that was created by a source or classification revision.

The operating response to an error is the smallest useful clarification. It should distinguish a missing mandatory identity or unit from an unrelated optional field. A valid narrower analysis remains available while the affected calculation is corrected.

W pp. 49, 62-64; R p. 4; P

PARTICIPATION / INCENTIVES

Separate reporting, enablement and commercial assistance

Different mechanisms should support different purposes.

Existing reporting

The established arrangement and its actual terms.

Enablement

A defined setup or improvement activity.

Campaign support

A separate commercial decision on eligible scope.

Illustrative design / independent requirements and outputs.

The existing reporting arrangement remains the starting point. The documented programme history records a 2025 major-KPI initiative with 20% of the normal distributor rebate linked to reporting, as stated on 22 September 2026. This describes a share of the existing rebate, not a percentage of parts purchases or a new Universe payment; the actual agreement determines the conditions.

Enablement is a different mechanism. It can support a defined setup or improvement activity that makes useful participation possible. A payment per record or per sensitive field would reward disclosure volume rather than useful work.

Deal of the Day assistance is campaign-specific. Good data can make a more precise offer and evaluation possible, and a defined commercial proposal can be considered for additional support. Approval should follow that campaign's purpose, eligible scope and economics rather than a general data-completeness score.

Continued use should be observed independently of these mechanisms. A participant may comply with reporting and never use the tool, or use the tool productively without making every optional contribution. Those are different behaviours and should be understood separately.

C pp. 3-5, 19, 21-22; U; P

PARTICIPATION / RECOGNITION

Recognise useful improvement

Make reviewed achievement visible without creating a public performance contest.

Implementation

A practical change with evidence.

Correction

A more accurate decision, even if the apparent opportunity falls.

Useful method

A reviewed example another participant can adapt.

Illustrative design / independent requirements and outputs.

Recognition can acknowledge a development practice implemented, a correction that improved a decision or a useful method that another participant can adopt. The evidence should identify the original objective, work completed and what changed on the participant's own basis.

The programme should not award status for the largest turnover, highest self-assessment score or most uploaded records. Those measures reflect different populations, business sizes and reporting conditions. Sensitive disclosure should never improve a participant's standing.

Where a participant agrees, a reviewed example can be shared through existing Isuzu communication or meetings. The example describes the method and its conditions, while private terms and unneeded identifying details remain restricted. Declining publicity does not remove access to the underlying tools.

The recognition mechanism supports participation when the participant values the result itself. If a badge becomes the main reason to contribute, the programme still needs to improve the commercial value returned.

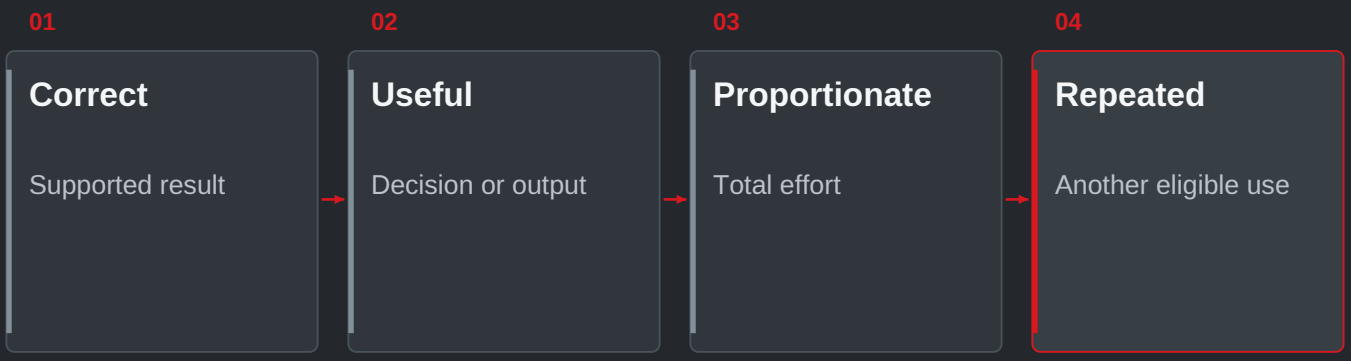

C p. 20; W pp. 43-46; P

EVALUATION

Prove usefulness at the level of the task

Correctness, adoption and commercial effect are separate questions.

The programme should assess whether the participant completed useful work correctly, whether the result changed a decision, how much effort was required and whether a comparable later task occurred. These questions should be answered for the selected application, not compressed into one universal programme score.

Proposed sequence / each stage retains its own evidence and decision.

Tender collaboration can be evaluated through proposal quality, preparation effort and the decisions obtained, with award results recorded separately. IDS progress can be evaluated through implementation evidence and use of the development practice, with reassessment separate. Deal of the Day can be evaluated through eligible activity, contribution and repeat purchasing on the agreed basis.

The eligible population and observation period matter. A dealer without a relevant project or a distributor without a suitable campaign is not disengaged because it did not open the tool that day. A result cannot be judged before the necessary follow-up period has occurred.

The measurement design should include incomplete, corrected and unsuccessful examples. A programme that learns from those cases is more useful than one that reports only successful screenshots.

W pp. 43-44, 67-68; R p. 15; P

ECONOMICS

Build the business case from decisions and effort

Programme value is not a percentage applied to a modelled market gap.

Parts gross profit

Net revenue less documented parts purchase cost.

Programme contribution

Additional support and costs, without double counting.

Capacity released

Comparable effort saved, not automatically cash.

Illustrative design / independent requirements and outputs.

Possible economic benefits include better-targeted commercial activity, more relevant product positioning, improved preparation capacity and additional contribution where supported. Each needs its own beneficiary, baseline and observation. The same increase in business must not be counted separately in the Atlas, a campaign and a tender.

The cost case includes source preparation, relationship validation, content maintenance, analytical work, participant effort, coordination, evaluation and any purchased capability. Initial development and continuing operation are different cost objects. An owner-built tool can reduce external cash needs while still requiring substantial internal capacity.

Financial comparisons should retain the agreed measure. Parts gross profit uses revenue less documented parts purchase cost. Programme contribution additionally considers costs and support not already included. Capacity released is time available for other work, not automatically a reduction in cash expenditure.

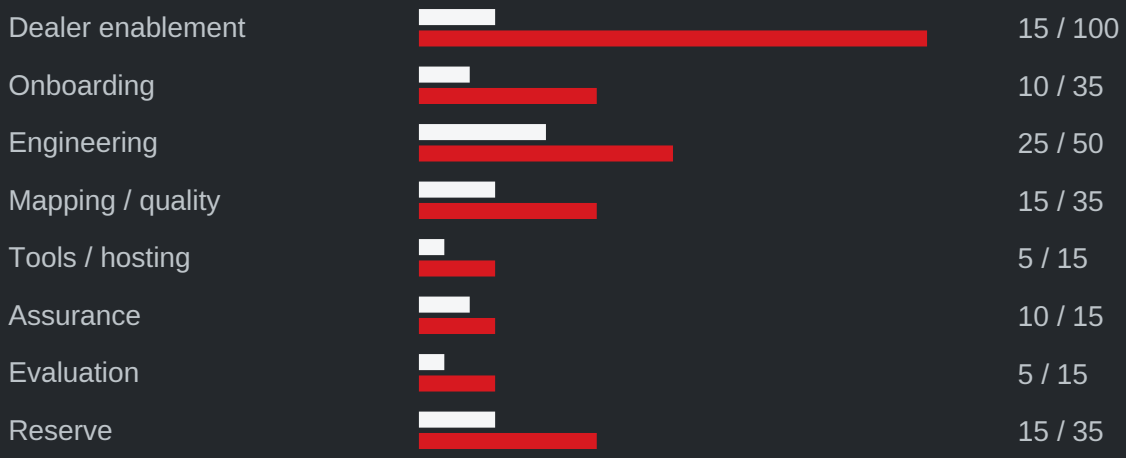

The proposed programme should be funded against defined deliverables and reviewed against observed usefulness. No realised Universe return, universal recovery rate or automatic conversion of a service-demand gap into revenue is established by the supplied material.

W pp. 36-39, 66-68; C pp. 27-39; AIM v0.3; P

FUNDING / PLANNING OPTIONS

Scale the investment to accepted work

The supplied alternatives are reference planning envelopes, not approved budgets or supplier quotations.

EUR thousands: 100 total / 300 total. Alternatives, not cumulative.

Reference planning envelopes / first 12 months from approval, ex recoverable VAT. C pp. 29-31, 22 Sep 2026.

The commercial planning paper dated 22 September 2026 sets out alternative incremental external cash envelopes of EUR 0, EUR 100,000 and EUR 300,000 for the first twelve months from approval. They exclude recoverable value-added tax. Internal effort and later operating costs are separate. The alternatives are not cumulative.

The EUR 100,000 and EUR 300,000 allocations cover dealer enablement, onboarding, selected engineering, mapping and quality, tools and hosting, independent assurance, evaluation and reserve. The EUR 300,000 option is EUR 200,000 above the EUR 100,000 total, not an additional EUR 300,000.

These envelopes remain discussion references. The selected applications, actual capacity, quotations and acceptance requirements determine any expenditure proposal. Deal of the Day support needs its own approved commercial treatment; it is not automatically funded by an enablement allocation.

The no-additional-external-cash route remains meaningful for a bounded owner-led proposition using authorised tools and controlled outputs. Its limits are the available time, expertise and continuity arrangements, not an assumption that operation is free.

C pp. 29-36; R p. 12; planning basis 22 Sep 2026; P

DELIVERY / OWNERSHIP

Keep the commercial logic close to the business

Reuse the analytical foundations and buy only the specialist work that is genuinely needed.

The business owner can define the commercial question, design the information exchange, prepare analytical examples and establish what a useful output should contain. Existing AIM, Atlas, PRISM and IDS work should be inspected and reused where fit for purpose rather than reproduced as parallel calculations.

Business ownership

Commercial logic and useful outputs.

Specialist work

Bounded access, reliability and recovery needs.

Ongoing operation

Source care, continuity and evidence of use.

Illustrative design / independent requirements and outputs.

Specialist work may be needed for access isolation, durable shared records, reliable imports, recovery or an agreed connection to company systems. Those are bounded implementation tasks with an accepted deliverable and a handover. A software label is not a substitute for the specific behaviour required.

Continuing operation needs a named owner and an absence arrangement. Source changes, corrections and revised programme content will occur even when the interface is stable. A second authorised person should be able to recover the selected version and reproduce an accepted result.

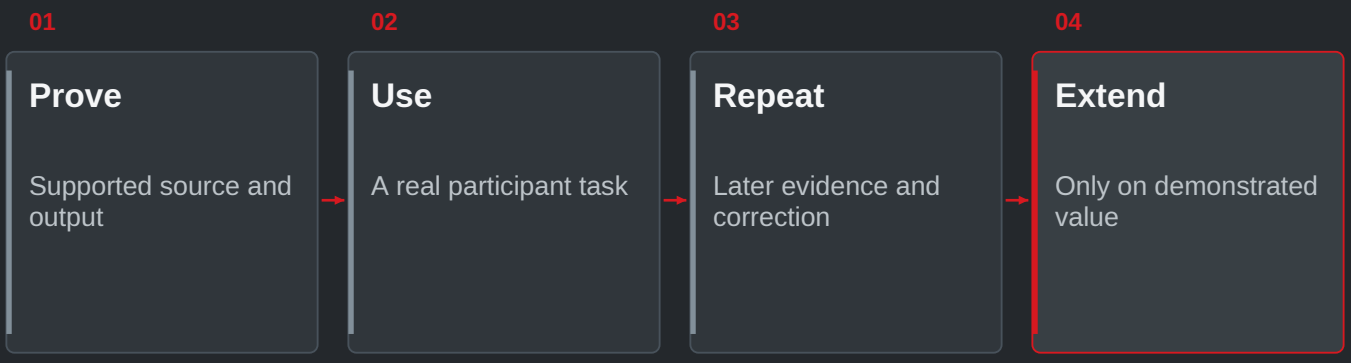

The first shared use can remain distributor-led and document-based where appropriate. A usable commercial proposition does not need to wait for every future integration, but an attractive HTML demonstration does not establish secure multi-user operation.

C pp. 35-36; R pp. 3, 13-16; P

ROADMAP

Prove, repeat, then extend

Expansion should follow a demonstrated participant return.

Proposed sequence / each stage retains its own evidence and decision.

The first stage establishes the supported source and the commercial output: a valid Atlas review, an actual IDS profile or a defined application draft. The next tests an end-to-end participant task with the appropriate audience and accountable functions.

Repetition then tests a genuinely later compatible source, a correction, the participant's continued use and the work required to maintain the result. A re-export of the same information is not a new commercial cycle. A synthetic demonstration can test behaviour but not prove recurring participation.

The application examples can progress at different speeds. IDS progress may begin with a defined development record; tender collaboration needs a real opportunity and participating functions; Deal of the Day needs an eligible commercial design and launch conditions. None should be shown as live merely because it appears on the map.

Broader participation should be based on the useful result, source coverage and operating capacity actually demonstrated. A narrower proposition that works repeatedly is a better foundation than an ambitious catalogue that nobody can maintain.

P; W pp. 53-55; R pp. 13-16

PILOTS

Two starting positions, two useful tests

ITUK and I Motors should demonstrate value at the levels their sources support.

ITUK

Within-year account analysis on the supplied 2025 coverage.

I Motors

National product analysis plus separate IDS development.

Applications

Real tender or campaign scope selected when ready.

Illustrative design / independent requirements and outputs.

ITUK provides a candidate for a purchasing-account Atlas review using the supplied calendar-2025 named-account information. The pilot can test whether product detail makes a commercial review more useful and whether a selected application preserves the correct account, period and evidence.

I Motors provides a national-analysis starting point, alongside separate dealer self-assessment information. The pilot can test the national product view and an IDS development example without assigning national purchasing to individual Portuguese dealers.

Tender collaboration should begin when a lead distributor and a real opportunity are selected. Deal of the Day should begin with a campaign scope that can be prepared and evaluated on accepted evidence. Neither application requires an invented participant count or a fabricated live example.

The evaluator should record the actual task, existing process, effort, useful output and reason for any non-use. The pilot proves what it demonstrates, not the readiness of the entire European network.

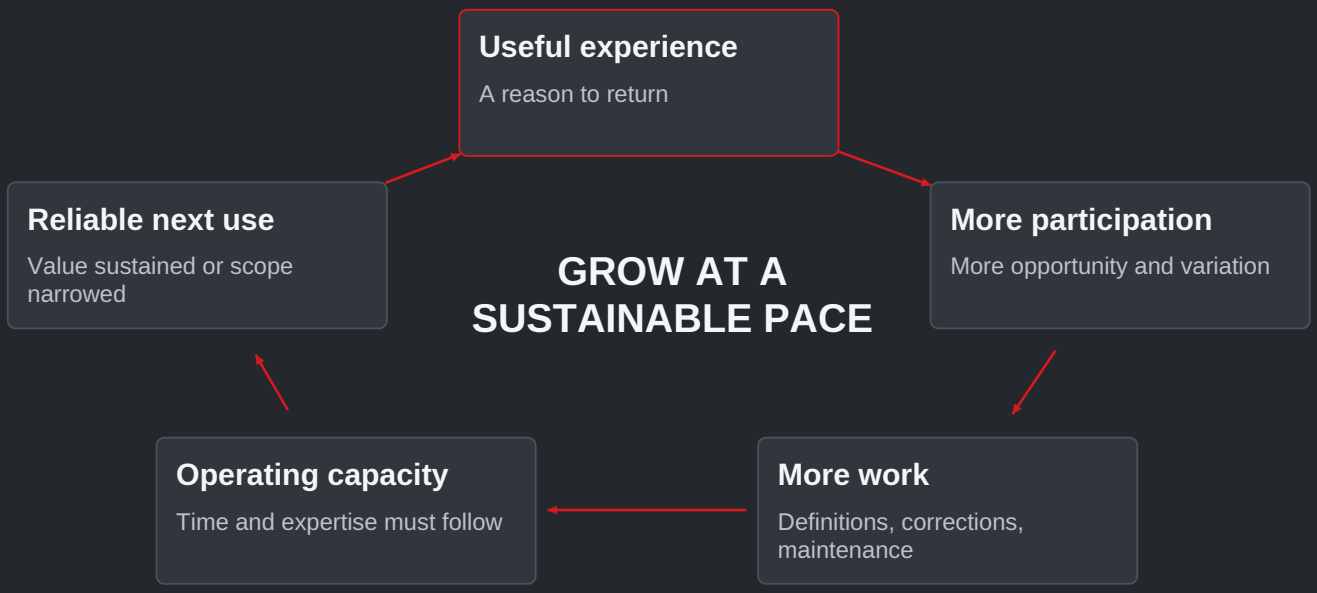

C pp. 8, 37; W pp. 54-57; R p. 15; U; P

SCALE / POSITIVE AND LIMITING DYNAMICS

Participation creates work as well as opportunity

Useful expansion needs an operating model that keeps the tools reliable.

More participants can provide richer evidence and create opportunities to reuse successful methods. They also introduce more account structures, source definitions, corrections and local commercial conditions. The effort does not disappear because the tools share one visual identity.

Proposed feedback mechanism / no measured causal effect is implied.

The programme should measure preparation, correction and maintenance effort by task. A more automated source is useful when it reduces recurring effort on a stable definition. A one-off aggregate may be better where the decision is narrow and the information rarely changes.

Expansion becomes counterproductive if source quality falls, private information is exposed or participants cannot obtain the promised analytical return. The correct response may be to narrow an application, improve the method or pause additional onboarding.

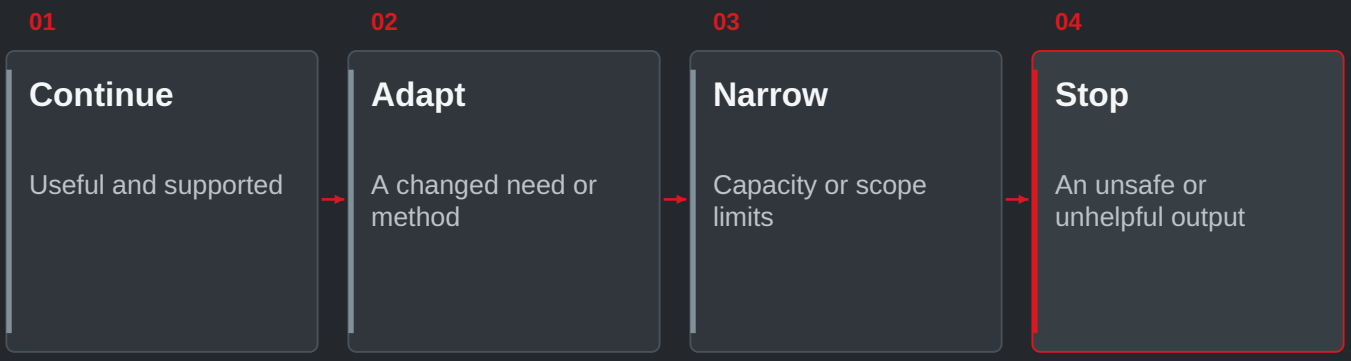

The positive mechanism and its limit should be reviewed together: useful tools encourage participation; participation increases learning and workload; operating capacity determines whether the next interaction remains useful.

W pp. 42-44, 57-58; C pp. 34-35; P

OPERATING CHOICES

Keep the programme commercially focused

Use clear decisions to stop complexity from outrunning value.

Proposed sequence / each stage retains its own evidence and decision.

Continue an application when the participant can identify a useful result, the evidence supports the analysis and the operating effort is proportionate. Adapt it when an honest limitation or local condition changes what it can deliver. Stop the affected output when a confidentiality or identity failure prevents safe use.

A new feature should solve a demonstrated problem. A recurring connection should improve a recurring task. A financial-support mechanism should have a defensible objective and evaluation. A visual improvement should make the decision easier to understand rather than conceal missing evidence.

The programme needs room for unsuccessful experiments. A Deal of the Day that does not improve the offer, a tender framework that duplicates preparation or an IDS project that participants do not use should lead to a changed design, not more compulsory reporting.

These decisions preserve the ambition by concentrating it. The programme becomes stronger when it can distinguish a useful commercial application from an attractive but unnecessary feature.

W pp. 43-44, 57-58; R p. 15; P

FUTURE APPLICATIONS

Keep the next possibilities visible

Candidate applications are examples to evaluate, not a fixed development promise.

Fleet economics

Selected cost components on an approved technical basis.

Private range study

A bilateral product-development case with ISZE.

Product-value evidence

Reviewed facts supporting a better offer.

Illustrative design / independent requirements and outputs.

A fleet-cost comparison could deepen the tender proposition where approved technical schedules and an eligible operating profile exist. It should begin with the cost components the evidence supports and should not be labelled a complete total-cost-of-ownership analysis prematurely.

A private range-development study could help a distributor and ISZE assemble a product case. ISZE may review related evidence centrally, while distributor comments and intentions remain private. No shared proposal board or automatic disclosure to other distributors is required.

A product-value evidence application could organise authorised specifications, product contents and reviewed comparative evidence. Technical claims would remain with the responsible authority. A missing demonstrated advantage can be a useful reason to improve the offer rather than create a stronger marketing claim.

Each possibility should state the decision it improves, the participant return, the smallest adequate information contribution and the resources needed to operate it. The programme remains open to better examples as its use develops.

U; P; W pp. 58-59

FUTURE / ASSISTANCE

Use AI to reduce effort, not replace judgement

The analytical record should remain understandable without a conversational interface.

Artificial intelligence (AI) could help locate permitted evidence, explain a product comparison, draft a tender brief or summarise a development record. It can reduce navigation and writing effort when it uses the same distributor, period and source basis as the underlying tool.

Assist	Calculate	Decide
Find, summarise and draft from permitted evidence.	Deterministic arithmetic and source definitions.	Human technical, financial and access authority.

Illustrative design / independent requirements and outputs.

Exact arithmetic, access restrictions and consequential approvals should remain outside generated prose. The assistant must distinguish recorded information, participant statements and proposed scenarios. It should not generate a confident explanation for a purchasing change when the source only records the change.

The user should be able to inspect the underlying evidence and use the essential functions without AI. A generated summary should identify what it relied on, preserve uncertainty and remain reviewable before external use.

A useful future assistant would help the user complete the commercial application already selected. It would not turn Universe into a generic question box, invent additional data rights or make ordinary support the programme's defining purpose.

W pp. 51-53; R p. 9; P

REFERENCE / ANALYTICAL BASIS

Keep the meaning beside the measure

Every result needs a defined scope, period, source and comparison.

Parts billed means ISZE sales to the stated distributor on the stated source basis. Sales to dealer means the distributor's recorded onward purchasing stage. Recorded workshop use is a separate observation. These values must not be added together as network revenue or subtracted to infer inventory without the required stock evidence.

A monetary result identifies its currency, price level, date and valuation basis. A quantity-only source does not create actual downstream revenue or gross profit. A permitted reference valuation is a reference valuation, not a transaction.

A quantified opportunity needs the euro basis, product family or service category and eligible fleet or exposure. Where the relevant population or economic basis is missing, report a descriptive observation or proposed investigation instead of assigning a recoverable-sales value.

The source register should retain the version used for the decision. A later source correction or classification revision can produce a restated result, while preserving what the participant saw and what the decision was based on.

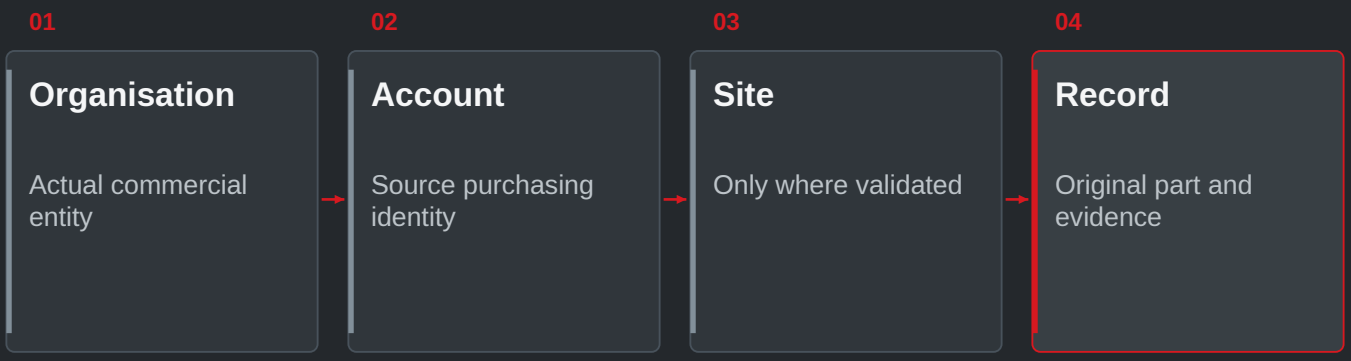

Evidence type	How to describe it
Recorded	A source event or quantity on its actual period and coverage.
Reported	A participant's explanation with attribution and date.
Modelled	A defined expectation or scenario with assumptions.
Confirmed	A specific decision or outcome supported by its own record.

W pp. 49-51, 64-68; N; P

REFERENCE / IDENTITIES

Keep organisations, accounts and sites distinct

A reliable connection preserves the original source identity.

Proposed sequence / each stage retains its own evidence and decision.

A purchasing account is not automatically a physical workshop. A dealer company can have several sites, and a source can combine them under one account. The programme should retain the original identifier and name, then add only validated relationships with their effective dates.

The same principle applies to parts. The original transacted reference remains available alongside its classification and separately governed successor or candidate BVP relationship. A later relationship must not silently rewrite a historical transaction.

IDS questions need their questionnaire version and source location as well as any local code. A repeated question code is not necessarily the same question. Assessment dates, reporting months and project-update dates serve different purposes.

Unmatched records remain visible in their appropriate source totals. A relationship should not multiply values or remove genuine business because the product cannot yet connect the record. The correction process should identify the smallest specific issue rather than reject an otherwise useful source.

W pp. 48-49, 62-64; R pp. 4, 10

REFERENCE / PERIODS AND POPULATIONS

Compare like with like

A correct calculation can still support a wrong conclusion when the scope differs.

Keep calendar and fiscal periods distinct. Isuzu's fiscal year runs April to March, while the historical examples in this paper compare full calendar years. The numerical reference for 2026 billing runs through 30 June 2026 and is a half-year, not a full-year observation.

Use compatible account, product and channel coverage. A missing month should not be filled with zero simply to create a continuous chart. An absent transaction line may be different from a source owner confirming no activity.

Historical market fleets can provide context where supported. They should not be distributed across dealers by sales share, visits or geography. Parts that fit several vehicle classes should not be allocated by fleet share and described as measured class purchasing.

The selected historical chart data in this paper is recomputed from the supplied aggregate extracts. That arithmetic check does not constitute a new audit of the source system or approval of every source-category definition. The example captions state the basis and the limits of the comparison.

Comparison	Required treatment
January-June versus full year	Do not describe the difference as growth or decline.
National versus dealer records	Use each at its supported level; do not invent allocation.
Recorded versus expected service	State the technical model and eligible population.
Old and corrected submissions	Replace the declared scope; do not add both versions.

N; O; W pp. 49-51, 54; M; F

REFERENCE / APPLICATION REQUIREMENTS

Each example has its own evidence needs

A missing optional source narrows the affected application, not the whole programme.

An application should retain the commercial objective, participant, source period, eligible scope, permitted audience and expected output. It then adds only the information needed for its own decision. There is no universal requirement to supply prices, stock, customer identities or workshop records.

Tender collaboration requires a real opportunity and defined participating functions before operating commitments can be made. IDS progress requires a validated assessment where an assessment is displayed and a separately agreed development project. Deal of the Day requires an eligible product and campaign definition before any offer is approved or launched.

The actual production implementation must test these requirements at the point of use. A demonstration checklist or a good-looking screen is not evidence that the operating permissions, source validation and commercial authority have been implemented.

Example	First useful output	Additional requirement for operation
Tender	A structured opportunity and support proposal.	Confirmed requirements, participants, authority and actual decision dates.
IDS progress	An explorable profile and a development plan.	Validated source identity and real project evidence.
Deal of the Day	A selected offer scenario and preparation brief.	Approved terms, practical launch conditions and evaluation basis.

U; P; W pp. 69-71; R pp. 10-11

REFERENCE / RECURRING INFORMATION

A small, stable standard supports repeat use

Agree definitions once, then handle actual changes and exceptions.

The proposed recurring standard describes business meaning rather than a prescribed technical file layout. The distributor and ISZE agree the included scope, reporting calendar, source owner and correction method before treating a source as a recurring exchange.

Retain identifiers as text, including any leading characters. Keep returns and adjustments distinguishable from positive activity. Source generation dates and versions identify what is new; a revised month replaces its declared predecessor rather than becoming an additional month.

The default exchange is price-free. Sensitive financial or operational additions require an application-specific purpose and audience. An approved locally calculated aggregate may answer the question without transferring the underlying commercial book.

Information	Business definition to retain
Organisation / account	Actual distributor and supported purchasing-account identity.
Product	Original reference; classification and relationships separately.
Period / quantity	Date meaning, calendar or fiscal basis, unit and signed treatment.
Coverage	Included products, channels and accounts; missing periods and wholesale scope.
Control / correction	Comparable control totals, generation date, version and predecessor.
Responsibility	Source owner and route for definition changes or corrections.

C pp. 21-22; W pp. 62-64; R p. 4; P

REFERENCE / TENDER PROPOSAL

A decision brief for the relevant Isuzu functions

Proposed structure for a real opportunity; blank information remains unconfirmed.

The brief should be prepared for the specific opportunity and shared only with its authorised participants. It should make the requested headquarters decision easy to identify, while keeping detailed supporting evidence behind the summary.

Each statement carries its status: documented requirement, distributor intent, proposed contribution or confirmed decision. Changes to scope or conditions identify the earlier version they affect. The record should keep support decisions, bid submission, award and related business separate.

Section	What the proposer completes
Opportunity	Lead distributor, source, requirement, known deadline and intended pursuit.
Combined offer	Vehicle and aftersales scope; participating functions and assumptions.
Requested decision	Specific support or confirmation required, recipient and decision deadline.
Commercial basis	Eligible activity, unchanged alternative, relevant costs and proposed contribution.
Responsibilities	Owner for each contribution; confirmed commitments and unresolved dependencies.
Outcome and learning	Actual submission, decision, known result and reviewed reusable lesson.

U; P; W pp. 29-31, 36-39

REFERENCE / DEAL OF THE DAY

A campaign record that can be evaluated

The proposed terms should be precise enough to distinguish the offer from the result.

The record should state the participant, commercial objective, original product references, application and pack basis, audience definition and intended validity. A complete draft remains a draft until the relevant conditions and authority are confirmed.

The financial comparison identifies baseline and proposed quantities, net prices, documented parts purchase cost, currency and effective dates. Fixed campaign expense and support are shown separately where they are not already included. A price-class margin is not substituted for the actual scenario margin.

The result record uses the same eligible scope and states its follow-up period. It identifies returns, product displacement, account or coverage changes and other interventions where known. A later purchase is an observation, not automatic proof that the promotion caused additional demand.

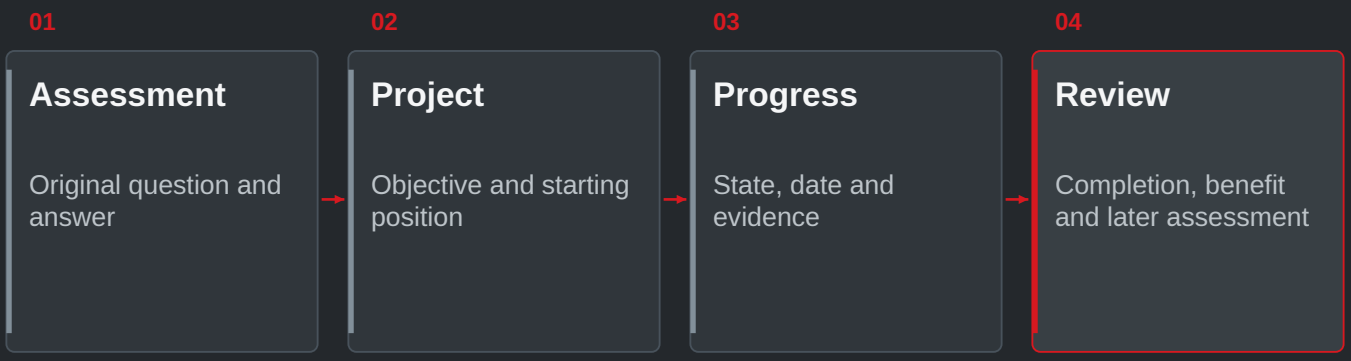

Record	Key distinction
Selection	Candidate versus eligible product and audience.
Assistance	Requested versus approved versus actually provided.
Economics	Gross profit versus contribution after additional campaign costs.
Launch	Planned dates versus actual dates and confirmed conditions.
Evaluation	Campaign activity versus lasting additional business.

U; P; AIM v0.3; W pp. 36-39, 67-68

REFERENCE / IDS PROGRESS

A development record the dealer can use

Retain the ambition, the evidence and the review separately from the assessment.

Proposed sequence / each stage retains its own evidence and decision.

The assessment reference contains its original source, questionnaire, actual answer and available date. The development record contains the selected objective, starting position, agreed milestones, owners and evidence of implementation. A later reassessment is a new record, not an automatically updated score.

Progress entries should identify the state, date, relevant evidence and person responsible for the next step. A completed milestone records what was accepted and by whom. A deferral, changed objective or missing supporting contribution remains visible with its reason.

The dealer should be able to retrieve its permitted development history. A reviewed example for wider use is a separate output with a deliberately limited audience and content. The original project does not become visible to other distributors.

Before a real shared implementation is accepted, test persistence, corrections, access, exports and a second-person recovery. The showcase demonstrates interaction in a local example only; it does not implement a secure company register.

U; W pp. 26, 48-49, 64-65, 68-71; P

REFERENCE / TERMS

A common language for the programme

Use the business meaning, and keep measured activity separate from proposed action.

Term	Meaning in this paper
ISZE	Isuzu Motors Europe, the European parts hub.
AIM / Atlas	Aftermarket Intelligence Model and the explorable product/commercial view.
IDS	Isuzu Dealer Standards: the dealer's recorded self-assessment.
PRISM	Parts revenue intelligence: commercial and relevant fleet context.
BVP	Best Value Parts, kept visible alongside Genuine in the analysis.
Parts billed	ISZE sales to the stated distributor on the stated source basis.
Sales to dealer	The distributor's recorded sales to its dealer/account population.
Gross profit	Revenue less documented parts purchase cost in the stated AIM measure.
Campaign contribution	Gross profit less additional campaign costs not already included.
Progress / reassessment	Project implementation versus a later actual dealer assessment.
Headquarters support	A specific contribution approved by the responsible manufacturer function.
Application example	A possible use of the programme, not a fixed catalogue or live commitment.

Business and writing context, 19 Sep 2026; AIM v0.3; P

REFERENCE / SOURCES

Source basis and design status

Prepared 22 September 2026. Historical observations, new proposals and illustrative arithmetic remain distinct.

The paper uses the supplied business, numerical and operating context and the original long-form Universe work as its reference base. The commercial applications and private participation design are programme proposals. No live deployment, participant acceptance, expenditure approval or achieved Universe return is asserted by the illustrations.

The historical charts use selected rows from the supplied original/BVP category-mix and spend-per-truck aggregates. Calculations were recomputed for this edition. The figures retain their original 2024/2025 periods, source-category definitions and contextual fleet basis. The underlying transaction systems were not re-audited.

The AIM visual reference is charcoal, red and Arial as documented in the supplied presentation design record. The PDF uses the metrically compatible Arimo font; the editable presentation specifies Arial. The HTML is an offline explanatory prototype with clearly labelled local examples.

Code	Reference and use
U / P	Programme direction and new design proposals, 22 September 2026.
W	Universe White Paper v1.1 revised, 21 September 2026; 80-page source.
C	Commercial and participation paper, 22 September 2026; product, economics and design.
R	Implementation roadmap, 22 September 2026; reuse and acceptance principles.
N / O	Numerical and operating context, as of 19 September 2026; billing to 30 June 2026.
M / F	Supplied category-mix and historical fleet-context aggregates, 19 September 2026.
AIM v0.3	Pricing Decisions component, confirmed financial rules dated 22 September 2026.

Source record. No raw billing or full price list is reproduced.
