# Build the first complete decision

Keep the browser interface. Reuse the existing analysis. Add the working record that connects evidence to an answer.

Universe should first make one purchasing review useful from beginning to end: identify the question, inspect the original parts, record the relevant explanation, obtain an accountable response and retain the next action. More services follow only when that sequence works. [C, pp. 6-7, 23; W, pp. 15-20]

**FIRST RELEASE OUTCOME**

An authorised user can open a scoped review, follow its evidence, create or continue a case, save an attributed response, and retrieve the decision after restarting the application. The same record distinguishes what the dealer owes from support owed by the distributor or Isuzu Motors Europe (ISZE).

## The product boundary

Retain the existing parts portfolio and the Aftermarket Intelligence Model (AIM), which organises products. Connect Isuzu Dealer Standards (IDS) as dealer self-assessment and PRISM as the separate commercial and fleet context. Keep Genuine and Best Value Parts (BVP) visible together. Do not reintroduce the sales cube or replace distributor transaction systems. [C, p. 6; W, pp. 24-29, 53]

| Workstream | Starting scope |
|---|---|
| Commercial review | Isuzu Truck UK (ITUK): a supported purchasing-account question. I Motors, Portugal: a national range question. Their data levels remain different. |
| Working record | A question, evidence, owner, response, decision, action and known outcome. Unknown outcomes remain unknown. |
| Technical delivery | Extend accepted components. Add durable shared records and controlled access only where those capabilities are missing. |
| Deferred by default | Network-wide rollout, new transaction processing, compulsory dealer uploads, automatic price changes, telematics and a mandatory artificial intelligence (AI) interface. |

## Ownership and acceptance

The product owner selects the first useful task and accepts scope. Source owners accept meaning; responding functions accept real cases; technical and commercial authorities retain their decisions. Before each release, record the tested application version, accepted scope, reviewer, remaining restrictions and next step. This plan does not replace those decisions.

Basis: Commercial revision [C], 22 September 2026, and revised White Paper [W], 21 September 2026. The delivery sequence and backlog below are new planning proposals, not software-completion claims. Delivery sequence: page 2. Tests: pages 10-11. Build backlog: pages 13-14. First development brief: page 16. Source key: page 17.

# The delivery sequence

Aim for an internal working release first; make external access and repeat operation separate acceptance decisions.

Planning assumption dated 22 September 2026: an internal working release in roughly four to six elapsed weeks and a controlled shared pilot in roughly ten to sixteen weeks. Week 1 begins when the current source code, bounded inputs and an assigned implementer are available. These are not supplier estimates or agreed deadlines.

| Indicative window | Work and participant result | Evidence to move on |
|---|---|---|
| Week 1 Foundation | Reproduce the selected existing output, identify reusable components and accept the first source contract. | An identified code version starts successfully; the chosen observation reconciles on its recorded basis. |
| Weeks 2-3 Connected review | Show the national or account question, original parts and the evidence that changes the decision. | Context stays intact. Unresolved classification, missing months and unsupported monetary values remain visible. |
| Weeks 3-5 Case continuity | Save a case, attributed explanation, response, action and outcome state. | Records survive restart; corrections are versioned; simultaneous edits cannot silently overwrite one another. |
| Weeks 4-6 Internal acceptance | Complete the same business task through the existing process and the proposed workflow. | An authorised reviewer can reproduce the result and identify what remains unresolved. |
| Weeks 5-8 Controlled access | Implement the approved identities, permissions, exports and operating configuration. | Independent access checks pass for the actual pilot scope. No wider audience is inferred. |
| Weeks 9-12 First pilot task | A distributor validates the question and returns a useful answer to a real dealer. | Owner, next update, delivered response, participant effort and usefulness are recorded. |
| Weeks 13-16 Repeat and handover | Process a genuinely later compatible cycle, a correction and a recovery exercise. | No duplicated activity; historical decisions remain traceable; a second person can operate the accepted version. |

Source and access work can run in parallel. A distributor-led review can test dealer value before portal access is ready, provided its output contains only permitted information. It must not be counted as proof that an external multi-user application has passed. [C, pp. 17, 37-39]

**REPLAN RATHER THAN PRETEND**

A simulated file can test correction logic. It cannot prove a recurring distributor exchange. When no compatible later submission is available, retain that limitation and move the repetition checkpoint rather than manufacture a second cycle.

Source sequence: [W], pp. 53-54; pilot and release conditions: [C], pp. 37-39. Week ranges and overlap are proposed planning assumptions. Scope, capacity and dependencies must be reviewed after the initial code inspection.

# Reuse before selecting new technology

The first development task is to establish what already works, not to choose a replacement framework.

The operating context describes an internal analysis application, derived data, static HTML views and a monthly process. These are reuse candidates, not evidence that the proposed shared Universe service is already implemented or publicly accessible. [O, sections 1-2, 5]

| Component | Proposed implementation decision |
|---|---|
| Browser interface | Retain useful HTML, CSS and JavaScript. Separate presentation, navigation, data access and calculation calls. Introduce React only where it solves a demonstrated maintenance problem. |
| Shared application | Use the existing suitable backend. Where a new case backend is genuinely required, Python/Django is the preferred candidate; do not replace a working implementation solely for consistency. |
| Analytical work | Reuse accepted calculation routines and derived results. Add a narrow interface to those outputs, not a second independently maintained version of every metric. |
| Durable records | PostgreSQL is the proposed store for shared cases, actions, permissions and source/version references. Decide whether existing infrastructure already supplies these functions. |
| Documents and images | Use approved private storage for selected evidence and authorised authentic product imagery. Preserve separate attachment audiences; do not copy entire source collections by default. |
| Hosting and identity | Confirm the supported company environment. Azure App Service with PostgreSQL is a documented candidate, not an assumed ISZE subscription or deployment permission. [T4] |

## Inspect and retain

Record the application version, start instructions, dependency versions, calculation entry points, data locations, export behaviour and existing tests. Identify the smallest proposed change and demonstrate a repeatable local start. Review a source archive for secrets before transferring it; credentials stay outside the handover.

## Keep application controls separate from the interface

Django supplies user and group permissions, but the implementation must still define Universe-specific organisation, account, case and attachment access. PostgreSQL row security can add protection, but privileged roles and table ownership require careful handling. Neither product name proves isolation. [T2; T3]

Use one maintainable application unless existing architecture dictates otherwise. Separate development, acceptance testing and production configuration. Select supported dependency versions during implementation and retain a version lock. No cloud account, paid tool or public publication is a prerequisite for preparing the internal review.

Reuse principle: [W], pp. 48-49, 53. Existing operation is reported as of 19 September 2026 [O], not freshly inspected here. Technical references [T1-T4] checked 22 September 2026; the proposed stack remains conditional on the current code and company environment.

# The information contract

Accept the meaning, coverage and correction behaviour of each source before its dependent calculation.

| Information retained | Minimum rule |
|---|---|
| Organisation and account | Stable distributor identity; original purchasing-account identity and name where supplied. Preserve combined accounts. Site and assessment links require explicit, dated validation. |
| Product identity | Original transacted part number as text. Classification release, catalogue pairing, supersession and approved application remain separate relationships. |
| Period and activity | Source event date or reporting month, calendar or fiscal clock, quantity and unit. State the treatment of positive activity, returns, credits and revisions. |
| Coverage | Included accounts, products, channels and transaction types; wholesale inclusion; missing, provisional and excluded periods. National information remains national. |
| Submission control | Supplying organisation, source owner, generation date, included period, version, declared predecessor and same-scope control totals. |
| Result traceability | Source/version references, calculation version, classification basis, population, price basis where used, permitted audience and relevant unresolved issues. |
| Working records | Separate cases, responses, actions and outcomes from imported observations. Their creation dates do not refresh the historical source period. |

## Proposed import behaviour

Receive a version into a review area, validate its required meaning and compare its controls. Accept only the supported scope. Publish its affected analytical results only after acceptance; preserve the prior valid view with its own date when an import fails. An unresolved optional input narrows the service rather than disabling unrelated work. [W, pp. 49, 62-64]

An identical submission adds no activity. A replacement names the accepted version and scope it supersedes; old and new versions are never added together. Reconcile annual controls separately from monthly observations and national controls separately from included dealer detail. Record the reason for a correction and the outputs affected.

**DO NOT DELETE GENUINE ACTIVITY**

For transaction-level sources, use genuine transaction or line identifiers where available. Identical-looking rows are not automatically duplicates. For monthly aggregates, use the agreed organisation/account/part/period/unit scope, without inventing transaction IDs. The import rule depends on the source type.

The recurring core remains price-free. Customer identities, dealer selling prices, margins, vehicle identifiers, full stock records and workshop job cards are not required merely to obtain a purchasing review. [C, pp. 21-22]

Source requirements: [C], pp. 21-22, 44; [W], pp. 48-49, 62-64, 75-76. The import sequence above is a proposed implementation of those requirements.

# The first working decision page

Explain the question before asking the user to interpret a collection of charts.

Use the proposed screen on page 7 of the commercial revision as the structural reference: a supported observation, what is known, what remains unresolved and the next useful action. It is a design reference, not proof of an existing implemented screen. [C, p. 7]

| Working element | Required behaviour |
|---|---|
| Visible context | Keep distributor, purchasing account or national scope, selected period, sales stage, source version and part scope visible. Show site only where validated. |
| Business question | State what changed and why it merits investigation. Keep commercial importance separate from evidence strength; no new universal 0-100 score. |
| Recorded movement | Use comparable periods and declared coverage. Keep ISZE parts billed separate from sales to dealer. A quantity-only record does not create downstream revenue. |
| Contributing parts | Retain original references, descriptions, classification status and any unclassified remainder. A source category must not be silently renamed as certified AIM membership. |
| Known and unresolved | Expose the limitation that changes the decision. Place detailed source, method, population and price information in an expandable evidence view. |
| Decision and follow-through | Offer a scoped next step: correct the interpretation, check an application, investigate supply, assess commercial support or record justified no action. Carry context into the case. |

## The ITUK starting task

Begin with the full-calendar 2024-to-2025 brake-pad source-category question described in the paper. Reconcile the contributing references before making a part-specific claim. Use available named-account calendar-2025 purchasing for a separate, supported within-year review; do not manufacture an account-level year-on-year comparison. [C, pp. 7-11, 37]

## The Portugal starting task

Begin with the national Genuine/BVP clutch-kit range question described in the paper. Keep the combined offer visible rather than treating a Genuine decline alone as lost business. A dealer can raise a relevant parts or improvement question, but cannot receive a purchasing history allocated from the national total. [C, pp. 12, 14, 37]

A user must be able to reach the account or part through a list or search without navigating a map. The concise review and the detailed evidence must show the same scope. A failed optional comparison leaves the recorded purchasing available. [W, pp. 15-19, 52-53]

No new commercial amounts, part pairings, dealer fleet allocations or price recommendations are introduced by these starting tasks. Exact references and permitted output content are established during source acceptance.

# Make commercial decisions testable

The calculation may be ready while the price recommendation remains unresolved.

| Possible outcome | Evidence required before the corresponding recommendation |
|---|---|
| Assess a price decrease | Exact eligible references; comparable competing offer; application, pack and commercial level; dated supply and stock explanation where relevant; aligned net terms and cost. |
| Assess a price increase | A specific, current part-level underpricing case on the same comparability basis. No actual underpriced reference is established by the papers; do not fabricate one to complete a demonstration. |
| Review the BVP offer | Supported product relationships and application; kit contents; supply; combined Genuine/BVP economics. Distinguish displacement within Isuzu from additional business. |
| Keep the price unchanged | A documented reason such as timing, inapplicability, unsupported comparison or a supply issue. Retain the decision and its scope; do not book an assumed avoided concession. |
| Prepare targeted support | A real request with part, quantity, dates and eligible terms, using the established Special Price Agreement (SPA) or other approval route. Approval, delivery and outcome remain separate. |

## The scenario record

Retain baseline and proposed quantities, comparable net selling prices, aligned unit costs, currency, dates and eligible scope. Record support and additional costs only where they are not already included. Each input has a source or is explicitly an assumption; a missing input stays missing. [C, pp. 13, 15, 27, 43]

**PROPOSED CALCULATION CONTRACT**

Gross profit = quantity x (net unit selling price - aligned unit cost). Gross margin = gross profit / revenue. Quantity preserving baseline gross profit = baseline gross profit / proposed unit gross profit. Show no ordinary positive-volume break-even when the proposed unit gross profit is zero or negative; report a loss-making baseline separately.

Use the same eligible scope for the baseline and proposal. For a mixed basket, specify the mix rather than apply a single unit-margin formula without justification. Test arithmetic using explicitly labelled test inputs, not invented Isuzu prices. A break-even quantity is a threshold, not a forecast of demand or customer acceptance.

## Evidence rules in the interface

A competitor comparison records application, source date, currency, tax, unit or pack, delivery and commercial level. A retail offer and ISZE net distributor terms are not directly interchangeable. A current reference price must not be applied to historical billing and described as historical pricing loss. [C, p. 13; O, section 6.4]

The proposed product can prepare a recommendation or a request. It does not authorise terms, certify fitment, prescribe dealer resale prices or infer end-customer price response from distributor purchasing.

Commercial cases and financial boundaries: [C], pp. 13-15, 27, 43; [W], pp. 20-25, 36-39. The formula is arithmetic, not a claim of measured Universe benefit.

# Keep the case, response and result together

Store separate states for the work, the evidence and the financial support.

The minimum case contains its reference, question, organisation/account scope, original parts, relevant period, evidence links, permitted audience, owner, responding function and next update. An attributed explanation includes contributor, statement date, period described and scope. Technical, supply and commercial responses retain their own authority. [W, pp. 15-16, 64-66, 76]

| State family | States to retain |
|---|---|
| Business state | Draft; Submitted; Under assessment; Awaiting specific information; Response issued; Action agreed; Resolved; Closed with outcome unknown; Withdrawn or no action. |
| Evidence state | Source-recorded; participant-reported; corroborated; modelled; unresolved. These labels describe evidence, not the contributor. |
| Support state | Not requested; requested; authorised; amended; delivered; cancelled. Closing the business case never automatically changes money to delivered. |
| Outcome record | Record the known participant or customer outcome and supporting source. Unknown is valid. A later invoice or an approved offer is not automatically a won quotation. |

## Conditions on transitions

A submitted live case needs an accepted owner and an actual next-update arrangement. Waiting for information identifies the missing item, intended recipient and reason. A substantive response identifies responder, answer, evidence and any conditions. A resolution states what was addressed; outcome-unknown closure records what is still unknown. [C, p. 24; W, pp. 40-41, 64-65]

An authorised support decision needs the applicable approval reference, terms, dates and eligible scope. Delivery needs its own evidence. A prospective support request must not create retrospective quotation history. An IDS improvement action can close with its completion evidence without changing the underlying assessment.

## Persistence and correction

Use durable server-side records for the shared service. Retain the original observation and append dated corrections or new versions. Detect a stale edit before it overwrites a newer one. Carry an unchanged case reference through reassignment, and never restart total elapsed waiting time when ownership changes. [Proposed technical behaviour; W, pp. 41, 49]

**A SMALL RECORD, NOT ANOTHER FORM**

Creating a case from a review should prefill supported context. Ask for the question and necessary next-step detail, not another upload of information already held. An approved existing answer may resolve a task without opening a new case.

Case taxonomy follows [W], pp. 64-65. Detailed transition conditions implement [C], pp. 23-25 and [W], pp. 40-41, 76-77. Acceptance evidence is required for actual application behaviour.

# Control access and make recovery real

The server and exported content must enforce the same permitted audience.

| Audience or operation | Required restriction |
|---|---|
| Dealer | Own permitted account review, own assessment and agreed shared case content. No other dealer results, ISZE costs or unrelated internal notes. |
| Distributor | Its validated account relationships and authorised joint cases. No automatic access to another distributor or every attachment held by ISZE. |
| ISZE case and specialist roles | Only the information required for assigned work. Technical application evidence need not include unrelated quotation details. |
| Commercial and finance roles | Confidential cost and support terms only within assigned authority. A general internal login does not grant unrestricted financial access. |
| Exports and search | Apply permission checks to every download, attachment, search result and derived answer. Hidden controls and preselected filters do not protect included data. |
| Account and role changes | Revoke or change access when the approved relationship changes. Recheck saved links and cached results; preserve only the historical access actually permitted. |

## Before participant-facing operation

Document the implemented access policy and test cross-distributor, cross-dealer and case-specific restrictions by attempting direct access, not just clicking menus. Keep attachments private and validate permitted upload types and size; use the approved scanning process. Retention, permitted export and departure behaviour are decisions by record type, not an invented universal duration. [C, pp. 25, 44; W, pp. 68-70]

For a Django deployment, use production configuration, protected secrets, a production server and encrypted sign-in traffic. Run its deployment checks, verify logging and review the actual settings. Passing framework checks does not replace the Universe-specific access tests. [T1]

## A recoverable service

Back up the database, permitted evidence files and the configuration required to restart. Retain code and dependency versions. Agree the maximum tolerable data loss and interruption with the operating owner, then demonstrate restoration against those requirements. Do not infer restoration capability from a successful backup message. [Proposed operating test; C, pp. 35-36, 44]

**THE ACCEPTANCE EXERCISE**

A second authorised person restores the accepted version, opens a selected case with its permitted evidence, reproduces the selected analytical result and records any loss or difference. Exercise a failed import and an unavailable optional source as well.

Information-use pattern: [C], pp. 17, 25, 44; [W], pp. 68-70. Technical deployment baseline: [T1]. Independent examination of implemented controls remains separate from the implementer's own tests.

# Connect the capabilities without forcing them

AIM, IDS, PRISM and tenders remain in the plan; each opens at the depth its evidence supports.

| Capability | First useful integration | What remains separate |
|---|---|---|
| AIM and BVP | Carry approved classification, original parts and documented candidate relationships into the review and case. | Source-category membership, supersession, catalogue pairing and technical fitment are different records. |
| IDS follow-up | Show a validated dealer's actual question and answer, version and available period. Record an agreed improvement and support owed. | No distributor audit score, inferred missing answer, invented assessment date or automatic score change after action completion. |
| PRISM context | Carry the supported historical population, period, analytical method and source date into the same question. | Measured purchasing, modelled expectation and observed workshop activity remain distinct. No dealer fleet allocated from national totals. |
| Tender support | Reuse the existing relevant, dated opportunity source. Link investigation, support request and response through one case. | Review, pursuit, bid, award and related parts billed are distinct. Notice value is not expected Isuzu parts revenue. |
| Availability and selected stock | Return a dated supply answer for a real parts question; add a selected stock study only when agreed. | Purchasing is not stock. A selected snapshot does not authorise a recurring full-inventory connection. |
| Reusable explanations | Retain a source-grounded response and an attributed reason. Promote a lesson only after scope and confidentiality review. | A local explanation does not causally allocate the entire category movement. |

## What is not on the critical path

Do not require a live tender connection, a complete IDS match, workshop data or all competitor prices before returning a valid purchasing review. Missing optional evidence narrows the affected answer. The first pilot combines a prepared review, a relevant parts question and a short decision record. [C, p. 23]

Reuse the tender monitor described in the operating context rather than commission another collector. Start from a selected current, sourced opportunity when there is a responsible responder. Closed tender-key work is not a new dependency. [O, sections 1, 5]

## AI comes after the record works

Artificial intelligence (AI) may later retrieve evidence or draft an explanation within the same permissions. Keep exact calculations outside generated prose and consequential decisions with the responsible people. Do not make a vector store, chatbot, autonomous action or paid coding assistant a condition of the first release. Essential tasks retain a non-AI route. [W, pp. 51-52]

Service scope: [C], pp. 6, 23; [W], pp. 24-31, 48-52. No integration or current external connection is claimed by inclusion in this roadmap.

# Acceptance: the analytical result

These are tests to implement and record, not tests declared passed.

For each test retain the tested application version, source or labelled test input, actual result, reviewer, date and evidence reference. Use real accepted data for reconciliation; use clearly separate test data for dangerous edge cases. A green test on one scope cannot certify an unrelated commercial claim.

| Test | Exercise | Required result |
|---|---|---|
| A01<br>Entity separation | Separate ITUK from Isuzu UK (IUK), and Universal Motors Israel (UMI) from Universal Trucks Israel (UTI). | No silent country combination. UTI is excluded from any population tied to the 2026 IDS round. |
| A02<br>Period integrity | Attempt a half-year versus full-year growth comparison; switch calendar/fiscal basis. | Reject or explicitly narrow the incompatible comparison. The actual clock and coverage remain visible. |
| A03<br>Scope integrity | Open Portugal national records and ITUK purchasing-account records. | Portugal does not acquire fabricated dealer detail; national and included dealer rows are not added. |
| A04<br>Missingness | Remove a month or optional source from a test input. | Show missing, not zero. Preserve a dated valid prior view where appropriate and explain affected outputs. |
| A05<br>Conservation | Join accepted identity and classification relationships to source quantities. | Same-scope quantity and monetary totals reconcile. Unmatched records remain visible; duplicate joins do not multiply activity. |
| A06<br>Control rows | Import monthly observations alongside annual control rows. | Controls reconcile separately; no annual-plus-monthly double counting. |
| A07<br>Repeat and revision | Re-import an identical submission, then a declared corrected version. | The repeat adds no activity. The correction replaces only its declared scope and retains the predecessor and affected outputs. |
| A08<br>True transactions | Provide distinct genuine line IDs with otherwise matching visible values. | Retain both actual transactions. Duplicate treatment follows the source contract, not visual similarity. |
| A09<br>Valuation | Open a quantity-only record; combine a dated reference price with historical quantities. | No invented downstream revenue or profit. Any permitted reference valuation retains its distinct price date and basis. |
| A10<br>Application | Present a candidate BVP relationship or a part spanning several vehicle classes. | No automatic fitment approval and no fleet-share allocation presented as measured class purchasing. |

**RELEASE CONSEQUENCE**

A failed source, period or relationship test blocks the affected figure or claim. It does not require suppressing unrelated, correctly supported analysis. The owner cannot waive a failing result merely to complete the demonstration.

Derived from [C], pp. 21, 26, 44 and [W], pp. 49-51, 69-71. Test identifiers and exercises are proposed implementation detail.

# Acceptance: the workflow and protection

Correct arithmetic, a useful response and safe access are separate requirements.

| Test | Required exercise and result |
|---|---|
| A11 - Financial scenario | Verify gross profit, gross margin and gross-profit-preserving quantity against independent arithmetic. Test missing cost, zero revenue, non-positive proposed unit gross profit and a changed basket. No demand forecast is inferred. |
| A12 - Context and restart | Navigate review to part to case, save and restart. Retain organisation, account, original part, period, source basis and permitted record. Reopen the same decision, not a reconstructed approximation. |
| A13 - State separation | Issue an answer, authorise support, close with outcome unknown and complete an IDS action in separate exercises. None automatically creates delivered support, a won case, monetary benefit or a changed assessment. |
| A14 - Corrections and edits | Add a scoped reported explanation, correct a source and attempt concurrent edits. Preserve original evidence and dates; identify restated results; prevent silent overwrite; do not promote a report to verified causation. |
| A15 - Optional contribution | Decline selected stock, workshop or competitor detail. Unrelated purchasing review and ordinary support remain available; the affected narrower answer is explained. |
| A16 - Access and exports | Attempt another distributor, another dealer, an unshared case attachment and an internal-cost field through screens, direct requests, search and exports. No prohibited information is returned or embedded. |
| A17 - Revocation and operation | Change role or account access, then retry saved links and sessions. Verify the approved access effect. Test protected settings, error handling and interrupted imports without exposing sensitive records. |
| A18 - Recovery and cover | A second authorised operator restores database and permitted evidence, restarts the accepted version and reproduces a selected result against the agreed recovery requirements. |
| A19 - Usability and response | Complete the task by keyboard and on the selected small-screen layout, including a missing-data case. Record total effort, actual next update, substantive response and participant-confirmed usefulness separately. |
| A20 - Repeat and AI boundary | Observe a genuinely later compatible source cycle before claiming repeat exchange. Where AI is added, test malicious document instructions and cross-account requests; permissions and approvals cannot be changed by retrieved text. |

The implementation team supplies technical evidence. A business/source reviewer checks interpretation. An independent reviewer examines external access and exported content. The pilot evaluator records the real participant experience. These are distinct acceptance responsibilities, even when the pilot is small. [C, pp. 31, 38-39, 44]

Required behaviours: [C], pp. 13, 24-27, 38-39, 43-44; [W], pp. 64-71. No current pass count, conformance certification or realised financial benefit is asserted.

# Funding follows accepted work

Preserve the paper's allocations; do not treat the programme ceiling as a software quote.

The following are the commercial revision's proposed alternative external cash envelopes for the first twelve months from approval, excluding recoverable value-added tax (VAT). They are not cumulative, approved expenditure or supplier quotations. Internal effort and later operating cost remain separate. [C, pp. 29-31]

| Allocation | EUR 100,000 route | EUR 300,000 route |
|---|---|---|
| Dealer enablement | 15,000 | 100,000 |
| Onboarding, training and launch | 10,000 | 35,000 |
| Targeted specialist engineering | 25,000 | 50,000 |
| Mapping, validation and quality | 15,000 | 35,000 |
| Hosting, tools, monitoring and backup | 5,000 | 15,000 |
| Independent assurance | 10,000 | 15,000 |
| Evaluation and recognition | 5,000 | 15,000 |
| Contingency and unreleased reserve | 15,000 | 35,000 |
| Total external ceiling | 100,000 | 300,000 |

## The focused engineering line is bounded

The paper proposes up to EUR 8,000 for restricted access and exports; EUR 7,000 for repeatable refresh and recovery; EUR 5,000 for context and case persistence; and EUR 5,000 for testing, documentation and handover. These sum to the EUR 25,000 engineering line. Inspect existing capability first, obtain scoped quotes and leave unnecessary work unpurchased. Independent assurance is separate. [C, p. 36]

## Proposed releases within the EUR 100,000 ceiling

Source and operating viability: up to EUR 20,000 cumulative. First useful dealer return and accepted separation: up to EUR 50,000 cumulative. Repeatable exchange and handover: up to EUR 85,000 cumulative. A separately approved exception can use the remaining EUR 15,000 reserve. Moving to EUR 300,000 means at most EUR 200,000 above the focused envelope, not another EUR 300,000. [C, p. 38]

**THE NO-ADDITIONAL-CASH ROUTE STAYS VALID**

Use existing authorised capacity for internal reviews, a controlled action record and separately restricted distributor outputs. Dealer feedback can return through the distributor. Do not assume free hosting, unlimited owner time or an externally supported portal. [C, pp. 29, 35]

Amounts and allocations: [C], 22 September 2026, pp. 29-31, 36, 38; first twelve months, ex recoverable VAT. Initial EUR 20,000 is proposed as engineering 8,000, data quality 5,000, assurance 5,000 and evaluation 2,000, within these same lines.

# Build backlog: the internal release

The implementer should execute these bounded tasks against the current code, not create a parallel replacement.

All tasks below are proposed and unaccepted. References A01-A20 identify the required evidence on pages 10-11. Estimates are deliberately deferred until the current implementation has been inspected; the calendar on page 2 is an initial planning range, not an effort quotation.

| Task and dependency | Deliverable | Acceptance and responsible role |
|---|---|---|
| B01 - Reproduce<br>First task | An identified application version, dependency lock, start instructions and a reproduced selected existing output. | Technical lead demonstrates a clean start; source owner checks the observed basis. Do not transfer secrets or raw billing into the handover. |
| B02 - Define sources<br>After B01 | Accepted pilot source contracts, control totals, period rules, supported uses and unresolved exceptions. | Source owner approves meaning and coverage. A01-A04, A06 and A09. |
| B03 - Validate relationships<br>After B02 | Versioned original-part classification and account relationships, with effective dates and visible unmatched records. | Relevant source/technical owner accepts each relationship. A05 and A10; no inferred site ownership. |
| B04 - Preserve context<br>After B02 | One shared selection for distributor, account/national scope, period, part and evidence basis. | Product owner follows the same question across the relevant views. A02-A03 and A12. |
| B05 - Complete the review<br>After B03-B04 | The decision page and original-part detail, known/unresolved evidence and scoped next actions. | Business reviewer reproduces supported observations and can explain why a recommendation remains unresolved. A04-A05, A09-A10. |
| B06 - Record the case<br>After B04 | Durable question, owner, next update, attributed explanations, responses and separate business/support/outcome states. | Technical and case owners verify restart, valid transitions and preservation of history. A12-A14. |
| B07 - Add the scenario<br>After B05 | A source-labelled, eligible-part financial scenario with missing-input and comparison checks. | Commercial/finance reviewer checks independent arithmetic. A11. No automatic approval or fabricated price-up case. |
| B08 - Produce the review brief<br>After B05-B06 | A selected permitted distributor or dealer brief and an internal evidence record kept separately. | Source and audience reviewers inspect actual exported content. A15-A16; internal calculations do not leak into the brief. |
| B09 - Accept internal work<br>After B05-B08 | An observed end-to-end internal task, defect list, tested version and before/after effort record. | Product owner accepts only supported scope. A01-A15 and internal parts of A19; no external-access acceptance implied. |

Backlog is new implementation planning derived from [C], pp. 6-8, 21-26, 35-38, 44 and [W], pp. 48-54, 62-71. Task references indicate dependencies, not completed work or a prescribed supplier contract.

# Build backlog: controlled use and repetition

Progress from a correct internal result to a supported participant experience.

| Task and dependency | Deliverable | Acceptance and responsible role |
|---|---|---|
| B10 - Implement access Policy starts at B02; release after B06 | Approved sign-in, organisation/account/case permissions, protected fields and attachment scope. | Technical owner and independent reviewer execute A16-A17 against the actual configuration. |
| B11 - Correct and refresh After B02-B03 | Repeatable selected import, declared replacement, failed-input behaviour and affected-result trace. | Source and technical owners execute A04-A08, A14 and A17. Existing accepted calculations remain the authority. |
| B12 - Deploy and recover After B06 and B10; prepare in parallel | Approved deployment, protected configuration, logs, backup, restoration and operating instructions. | Operating owner accepts recovery requirements; second person demonstrates A17-A18. External use also requires B13. |
| B13 - Examine independently After B08 and B10-B12 | Access/export test record, remediation evidence and the exact permitted pilot audience. | Independent reviewer accepts A16-A18 or records restrictions. No blanket certification beyond tested scope. |
| B14 - Run the dealer task After B09 and audience acceptance | Distributor-validated task, named case owner, substantive response and participant usefulness record. | Distributor and evaluator observe A15 and A19. A controlled document route is allowed; it does not certify portal functionality. |
| B15 - Demonstrate repetition After B11 and B14 | A genuinely later compatible source, correction review, follow-up and another eligible participant task. | Source owner and evaluator record A20 and the observed participant behaviour. A test fixture is not a recurring submission. |
| B16 - Transfer operation After B12 and B15 | Second-person run, restoration evidence, unresolved issues, cost owner, support arrangements and absence plan. | Operating owner accepts the tested version and limits. A18; independent and business findings are closed or explicitly restricted. |
| B17 - Add a justified service After accepted core; own evidence needed | Selected IDS, PRISM, tender, application or stock task with defined input, audience and returned work. | Relevant responding function accepts the service-specific evidence and responsibility. No universal data prerequisite. |
| B18 - Evaluate expansion After B14-B16 | Decision to continue, narrow, stop or broaden based on usefulness, effort, repeatability and evidenced economics. | Product owner approves costed next scope. No implied release of reserve or automatic EUR 300,000 programme. |

Access design begins early; the table does not defer security until after interface development. Equally, broader portal work must not postpone a properly restricted, distributor-led test of the service's practical value. [C, pp. 17, 25, 37-39]

Proposed backlog. Independent assurance and live participant evidence are separate from developer tests. Funding conditions remain the proposals in [C], pp. 31, 36, 38-39; these tasks do not approve expenditure or dealer contact.

# Run the pilot as an accountable service

The pilot has to prove returned work, not simply a successful upload.

| Operating question | Record before or during the selected task |
|---|---|
| Who owns the answer? | A participant-facing owner, assigned substantive responder, deputy or escalation route and an agreed next update. Role descriptions do not substitute for accepted assignments. |
| Who takes part? | A bounded cohort selected through each distributor, with actual account/site relationships and permitted audience. No invented dealer count or automatic invitation. |
| What is the existing task? | The real question, source period and comparable current-process steps. Observe source preparation, correction, review, response and follow-up effort. |
| What came back? | The substantive answer or justified unresolved decision, source/authority, action owner and known delivery. An acknowledgement is recorded separately. |
| Was it useful? | Participant-confirmed usefulness and correct completion of the eligible task. Record limitations, corrections, reasons for non-use and whether another relevant task occurs. |
| What did it cost or earn? | Actual external spend and incremental effort, stated beneficiary, comparison, known outcome and overlap checks. Capacity released, support paid and incremental profit are different measures. |

## The two pilot questions remain different

ITUK tests whether a prepared own-account review earns a useful local explanation and response. Portugal tests whether a national range review plus a dealer-chosen support task is valuable before dealer-attributed purchasing exists. Do not measure Portugal against a fictional ITUK-style account history. [C, p. 37]

## Measure repeat use without penalising truth

Separate the established reporting obligation from voluntary use. A participant with no eligible task is not inactive. Unknown, several contributing factors, a correction and justified no action are valid responses. Additional dealer enablement should remove a defined setup obstacle, not reward uploaded rows or sensitive disclosure. [C, pp. 18-20, 39]

The paper proposes observing the next two eligible cycles after additional support ends, without withdrawing normal service or changing the existing rebate to manufacture adoption. Agree numerical targets only after measuring the baseline and accepted response capacity. [C, pp. 19, 39]

**STOP, NARROW OR CONTINUE**

Stop the affected external output for an unresolved access or identity failure. Pause expansion of a service that has no responsible answer. Redesign a return that repeatedly costs more effort than participants judge worthwhile. Continue only on the demonstrated scope; a single useful case is not network-wide readiness.

Pilot and evaluation requirements: [C], pp. 18-20, 24, 37-39; [W], pp. 39-44, 67-68, 76-77. Actual assignments, response dates, eligible population and expenditure remain operating records to complete.

# The first development brief

Begin with the current application, one reproducible observation and a small, reviewable change.

**WORK INSTRUCTION**

Extend the accepted Universe application to complete a source-aware purchasing review and a persistent case. Reuse the existing interface, calculations and approved sources. Do not begin with a new dashboard, a new analytics pipeline or an invented dealer demonstration.

## Inputs to provide to the implementer

An identified current application version; its startup and dependency instructions; the selected authorised source extracts or access arrangements; the approved classification and relationship basis for the chosen task; and the expected existing output. Remove credentials, production secrets, raw billing and full price lists from any distributable handover. Keep sensitive computation within its authorised environment.

## The first accepted change

Complete B01-B04: reproduce the selected output, document its actual source meaning, identify unresolved relationships and preserve distributor/account-or-national scope, period, original part and source basis across navigation. Supply the changed source, start instructions, reconciliation evidence and actual test results. State clearly which decisions or inputs remain unresolved.

## The next accepted change

Complete B05-B06: make the decision view useful and save its connected case. A reviewer must be able to correct the interpretation, assign the next step and reopen the record after restart without silently changing the historical basis. Keep application, supply, financial approval and customer outcome separate. Add the financial scenario only on its eligible evidence.

## Acceptance record for each increment

| Record | What must be entered |
|---|---|
| Version and scope | Exact application version, changed components, services and participants included, source versions and excluded claims. |
| Evidence | Relevant A01-A20 results with actual observations, source/control comparisons and links to permitted evidence. |
| Decision | Reviewer, acceptance date, unresolved defects, permitted audience and whether external use remains restricted. |
| Continuity | How to start, update, correct, restore and revert; responsible operator and deputy; next agreed review. |

Do not report features as built because this brief describes them. Do not report tests as passed because the expected result is written down. Keep implementation evidence, source acceptance and participant usefulness separate. The next release starts from the last accepted version and its recorded limitations.

This is a new execution brief derived from [C], pp. 35-38, 44 and [W], pp. 48-54, 69-71, 76-77. It does not supersede an accepted application or authorise production deployment, external sharing, expenditure or price changes.

# Source and decision record

Business requirements come from the papers; delivery choices remain proposals until accepted.

| Reference | Source and use |
|---|---|
| [C] | Isuzu Universe - Commercial and participation revision, 22 September 2026, 46 pages. Primary basis for the first commercial workflow, pilot distinction, funding allocations, response obligation and acceptance conditions. |
| [W] | Isuzu Universe White Paper, version 1.1 revised edition, 21 September 2026, 80 pages. Detailed basis for source contracts, business objects, case states, service boundaries and tests. |
| [O] | ISZE operations, open work and caveats, as of 19 September 2026; especially sections 1-2, 5-6. Reported existing operation, reuse constraints, closed work and source defects. |
| [N] | ISZE numerical context, as of 19 September 2026, especially sections 0 and 11-12. Numerical authority, billing reference horizon through 30 June 2026 and restrictions on fleet forecasts and unpublished measures. |
| [B / G] | ISZE business and writing context, as of 19 September 2026. Entity separation, commercial roles, reporting clock and participant-facing terminology. |
| [T1] | Django documentation, Deployment checklist, version 5.2; checked 22 September 2026. Deployment settings, protected secrets, production server, encrypted traffic, logs and backup considerations. |
| [T2] | Django documentation, Using the Django authentication system, version 5.2; checked 22 September 2026. User/group permissions are a starting mechanism, not a claim of implemented Universe access control. |
| [T3] | PostgreSQL documentation, Row Security Policies; checked 22 September 2026. Additional database isolation and privileged-role/owner limitations. |
| [T4] | Microsoft Learn, Deploy a Python Django web app with PostgreSQL in Azure; checked 22 September 2026. Documented hosting candidate, not confirmation of subscriptions, credentials or approval at ISZE. |

## Decisions introduced by this roadmap

The indicative calendar, task identifiers B01-B18, test identifiers A01-A20, technical preference and order of implementation are planning proposals dated 22 September 2026. They operationalise the source requirements; they are not supplier quotations, approved assignments, completed software or new commercial results.

## Keep the source clocks intact

The numerical reference uses billing through 30 June 2026. The historical pilot examples retain their own calendar periods. A new case date or newly received file does not silently update other sources. Do not use a fleet forecast beyond the supported historical basis or a current price snapshot as a historical transaction price. [N; C, pp. 26, 43-45]

The exact dark treatment documented in the commercial revision is charcoal #24282C with Isuzu red #D71920 and light text. This roadmap follows that palette. [C, p. 46]

The earlier delivery roadmap referenced by [C] is not declared superseded by this document. Acceptance always refers to the identified operating version and its actual evidence, not to the most recently written plan.
