WHITE PAPER
Commercial & participation revision
22 September 2026
For management review

Universe

Better parts decisions.
A better reason to share.

Turn the information distributors already provide into useful work — and earn the dealer context that makes the next decision better.

A prepared review. A supported answer.
A decision with an owner and a result.

From asking for data to returning commercial value.

Developed from the supplied White Paper 1.1, revised edition, 21 September 2026.
Includes the participation proposition, quantified examples and three funding alternatives.
Proposed services, expenditure and outcomes are kept distinct from existing evidence.

READING GUIDE

From the proposition to the first proof.

The main paper explains the commercial exchange and the decision to take. The appendices retain the calculation basis, assumptions and acceptance conditions.

The proposition

Executive proposition and recommended decision 3
Why the request to distributors must change 4
The product and the commercial decision page 6
What the supplied evidence supports 8

The commercial return

What ISZE gains 9
ITUK and Portugal: measured commercial examples 10

The management decision 41

Working reference

Assumptions, calculations and acceptance 42
Source, revision and research record 45

Prepared 22 September 2026. Source baseline: White Paper 1.1 revised, 21 September 2026. This is a dated review edition; no new operational version or automatic supersession is asserted.

COMMERCIAL & PARTICIPATION REVISION

A commercial service that earns participation

Keep the existing reporting incentive, but make useful work — not compliance — the reason distributors and dealers return.

Isuzu Motors Europe (ISZE) needs a better explanation of what happens after it bills parts to a national distributor. More files alone will not provide that explanation. Universe should connect a purchasing observation to the relevant product, vehicle context, local explanation, commercial decision and subsequent result. The distributor remains the commercial intermediary; the dealer receives a practical service rather than another reporting obligation.

The business owner describes a long history of difficult, inefficient requests for distributor information, with insufficient visible return to the contributor. In 2025, ISZE began requesting major key performance indicators (KPIs), with **20% of the normal distributor kickback linked to reporting**. This is an existing incentive, not a new Universe benefit. The exact reporting conditions remain those of the existing arrangement. [U1]

The proposition for each participant

For ISZE: identify the parts and accounts worth investigating, distinguish pricing from supply or stocking issues, assess more selective support, and record the result. **For distributors:** receive a usable review of their own network or national business, better-evidenced support decisions and less repeated preparation. **For dealers:** understand a relevant purchasing question, obtain suitable parts guidance or a quotation response, and see the help that the distributor or ISZE has agreed to provide.

The recommended starting decision

Approve an **owner-led pilot with a conditional EUR 100,000 first-12-month external cash ceiling**, rather than a full outsourced platform. Release up to EUR 20,000 initially against accepted, costed work; retain later releases until a useful dealer interaction and a repeatable exchange have been demonstrated. Start the internal analysis and prepared reviews with existing authorised resources. The EUR 300,000 alternative is a later total envelope, justified only by observed participation and operating needs. All amounts are proposals, excluding recoverable value-added tax (VAT). [U2; P]

> THE COMMERCIAL POINT
>
> The first proof is not that a distributor sends another file. It is that a dealer receives something useful, contributes context without unnecessary effort, and chooses to use the service again for relevant work.

The supplied evidence supports historical purchasing analysis, not a realised Universe return. This paper therefore quantifies actual examples, conditional commercial mechanisms and break-even requirements separately. It does not convert a modelled market gap into promised sales.

Sources: [W] pp. 5-10, 36-44; [U1] business-owner clarification, 22 September 2026; [U2] supplied review brief. Funding and operating design: proposals [P].

COMMERCIAL & PARTICIPATION REVISION

From repeated requests to a useful exchange

ISZE must change what it offers when it asks, not simply change the form in which distributors reply.

According to the business owner, ISZE has sought distributor data for many years, but the relationship has been difficult: requests have not always been efficient, and the benefit to the distributor has not been sufficiently clear. This is a description of the commercial relationship, not a finding that every distributor refused to cooperate or that no previous analysis was useful. [U1]

The KPI initiative introduced in 2025 created a stronger reporting incentive. The owner confirms that 20% of the normal kickback is attached to providing the requested information. That can encourage the agreed submission. It does not by itself explain a purchasing movement, make data preparation easier, or give a dealer a reason to take part. [U1]

20% Remainder of the normal rebate

Business-owner statement, 22 September 2026. The highlighted 20% is a share of the normal distributor rebate linked to KPI reporting, not a percentage of parts purchases or an additional payment. The balance is not described here as unconditional.

Manufacturer authority is not the same as practical cooperation

ISZE can make requests and apply agreed commercial conditions. The owner also describes a European network with many independent distributors, where broader information exchange depends substantially on goodwill and perceived usefulness. Universe should work within that reality. It must distinguish existing obligations from additional information that a participant chooses to share for a specific purpose. This paper does not infer a general legal entitlement to distributor or dealer records. [U1]

THE NEW APPROACH

The change in the request: from “Please send more information so that we can understand your business” to “We have prepared a review from the information already available. Here is the decision it can support, the one missing detail that would improve it, and the answer we will return.”

The rebate remains the starting mechanism. A reliable commercial service should make the information exchange worth continuing independently of that mechanism. Whether it succeeds is an adoption hypothesis to test, not a benefit already achieved.

Sources: [U1], dated 22 September 2026; [W] pp. 9-12, 32-35, 43-44. The historical account and rebate percentage are owner-confirmed; the proposed change in approach is [P].

COMMERCIAL & PARTICIPATION REVISION

The promise must run in both directions

Every additional request should name the decision, the smallest useful contribution and the work returned.

Participant	Contributes	Receives
ISZE	Parts knowledge, approved references, commercial assessment and a dated supply response where relevant.	Better-qualified investigations, more selective support, reusable explanations and an outcome record.
Distributor	The existing agreed report; coverage and account definitions; selected commercial context.	A prepared national or dealer-network review, contributing product detail and an accountable supplier response.
Dealer	A relevant question, a correction, a local explanation or an outcome where known. No duplicate upload by default.	A concise own-business review, a suitable application or commercial answer, and visible follow-through.

The exchange is not symmetrical in data volume. ISZE may receive a recurring distributor extract while a dealer contributes a single explanation during a review. That explanation can be more valuable than another large file if it prevents a wrong commercial decision. The dealer should not be expected to produce a full dataset merely to confirm that an application is irrelevant or that a particular order was exceptional.

A request worth making

A proposed distributor message is: *“We will reuse the reporting you already provide. In return, we will prepare a review of the covered parts business, identify the references behind the questions and coordinate any support we agree. We do not need your selling prices for the core review. When additional information would change a decision, we will explain the purpose, audience and return before asking.”*

For a dealer, the invitation should be narrower: *“Your distributor has prepared a review of your recorded purchases. Please check whether this question is relevant to your business. You can correct the interpretation, ask for help with a particular part and follow the answer without resending the purchasing file.”*

> **THE COMMERCIAL POINT**
>
> Ordinary support must not depend on disclosure unrelated to the case. Better evidence can make a request easier to assess; that is different from paying for data volume or requiring access to an entire commercial book.

Sources: [W] pp. 9-12, 32-36; [U1-U2]. Participant wording and return commitments are proposals [P], not messages sent or service agreements.

COMMERCIAL & PARTICIPATION REVISION

One decision, supported by three capabilities

Universe is the shared commercial experience; AIM, IDS and PRISM contribute different evidence to the same decision.

AIM — which products?

The Aftermarket Intelligence Model organises parts by family, product group and detailed part type. It makes a mixed total commercially understandable.

IDS — which declared practice?

Isuzu Dealer Standards records dealer self-assessment. It supplies a relevant discussion point and a starting point for agreed improvement, not a distributor audit.

PRISM — in which context?

The market and fleet analysis adds the relevant vehicles, historical exposure and explicitly modelled expectations. It does not invent dealer-level demand.

Detect → **Explain** → **Decide** → **Act** → **Measure**

The same product language can be applied to Genuine and Best Value Parts (BVP), while keeping the two product lines visible.

AIM prevents a filter element, a housing and a kit from being treated as the same commercial product. PRISM can show that an apparent comparison concerns a different vehicle mix or an uncertain service assumption. IDS can identify a relevant self-assessed practice to discuss. None establishes the cause of a purchasing change on its own. [A; W]

The useful addition is continuity. The selected distributor, purchasing account, period, part and question remain together through investigation, response and review. A case means that connected record; it is not necessarily a complaint or a discount request. The participant should not need to reconstruct the same evidence for technical, supply and commercial colleagues.

A product, not a new transaction system

Universe should reuse the existing parts portfolio, analytical routines and assessment records. It is not a replacement for distributor accounting, stock or workshop systems. ISZE continues to sell to distributors, not directly to their customers. The product must not become a service-job ordering platform, an awards platform, a dealer league table or a conversational interface that merely paraphrases reports.

> **THE COMMERCIAL POINT**
>
> The difference from a dashboard is the completed decision: the evidence was checked, a responsible person answered, an action or justified no-action decision was recorded, and the next review knows what happened.

Sources: [A] slides 3, 6-10, 14, 16-19; [W] pp. 5, 15-19, 48-54. The connected workflow is a proposed design [P], not proof of an integrated live application.

COMMERCIAL & PARTICIPATION REVISION

The commercial decision page

The opening view should explain the question and next decision before deeper analysis. This example concerns Isuzu Truck UK (ITUK).

PROPOSED INTERFACE / NOT A LIVE PRODUCT SCREEN

ITUK • UK TRUCKS • BRAKE-PAD SOURCE CATEGORY

Investigate the purchasing change before changing price.

EUR 302,366	-13.0%	22,389
Parts billed in calendar 2025	Versus calendar 2024	Trucks in the stated fleet context

Known	Still to establish
Billing fell from EUR 347,389.58 to EUR 302,366.25; recorded quantity fell from 4,562 to 3,402.	Exact contributing pad references; relevant dealer pattern; stock, supply and application explanations.
The comparison is ISZE billing to ITUK, over two full calendar years.	A valid competing offer; approved BVP applicability; aligned costs and eligible terms for a price decision.

Proposed next action: reconcile the category to original part numbers, then review the relevant dealer evidence with ITUK.
Owner: ISZE account lead and ITUK parts manager; assignment to be agreed.
Financial result: not yet established. A price reduction is not approved.

This page combines a supported observation with an explicit decision boundary. It does not require management to interpret a map, a fleet graphic and several disconnected charts before understanding the commercial question. The part detail and financial scenario are available when the user needs them, but unknown information is not filled with realistic-looking placeholders.

The fleet figure is the calendar-2025 spend-per-truck context using the Driver and Vehicle Licensing Agency (DVLA) March 2026 register. It is not the internal class-split service denominator, a dealer fleet or proof that every truck uses these pad references. The category totals are retained from the supplied source summary, not newly certified AIM membership.

Sources: [A] slides 11 and 18; [M] ITUK brake-pad category, CY2024/CY2025; [F] fleet context; calculations checked 22 September 2026. All screen layout, roles and actions are proposed [P].

COMMERCIAL & PARTICIPATION REVISION

Use the data at the level it actually supports

The two pilots should demonstrate useful work at different levels, not force a false symmetry.

Evidence available	ITUK: UK trucks	I Motors: Portugal
ISZE parts billed	Historical distributor-level billing. Keep its period and exclusions.	Historical distributor-level billing. Keep its period and exclusions.
Sales to dealer, calendar 2025	Named purchasing accounts: 64 dealer names, 12 calendar months in the file.	National part-by-month information; no dealer identity in the supplied source.
Comparable dealer history	Within-year patterns are possible. A second comparable named-dealer year is not established here.	No dealer purchasing history can be attributed from the national total.
Dealer self-assessment	Use recorded answers only where the source and account relationship are validated.	Use the available assessment independently of national purchasing.
Stock, customer outcomes and causes	Not supplied as a complete recurring source for this service. New cases can begin recording evidence.	The same limitation; a new dealer question can still be handled.
Dealer fleet or market responsibility	Not established by a purchasing account or a workshop name.	Not established by geography or a national vehicle total.

The calendar-2025 ITUK monthly dealer file contains 66,018 rows and 5,559 part numbers; the selected dealer-account/part/month keys have no duplicates. These are data-coverage checks, not adoption or sales-success measures. Sixty named accounts contain observations in every month; the remaining accounts have shorter recorded coverage. An absent row does not by itself prove zero activity. [D]

The same combined source also contains ITUK national totals. Those rows are not added to the dealer rows. Annual control rows are not added to monthly observations. Portugal remains a valid national-review pilot even without dealer-attributed purchasing. The return should be narrower, not fictional.

> **THE COMMERCIAL POINT**
>
> A source can be accepted for national analysis and rejected for dealer comparison at the same time. Missing optional information narrows the answer; it does not erase unrelated useful work.

Sources: [D] supplied sales-to-dealer data, calendar 2025; selected monthly dealer-level records independently checked 22 September 2026. [W] pp. 18-19, 54-57; [R] pp. 8-11, 35-37.

COMMERCIAL & PARTICIPATION REVISION

What ISZE gains from the exchange

The benefit is more precise commercial intervention, with an explanation and an outcome — not simply a larger database.

Data made usable	New commercial possibility for ISZE	Economic mechanism to test
Part identity plus comparable purchasing	Locate the actual product range behind a movement rather than respond to a broad turnover total.	Concentrate account effort; avoid support on unaffected references.
Dealer purchasing plus local explanation	Separate a national range issue from a particular account, order, supply problem or moved contract.	Target a relevant action instead of a blanket promotion; confirm whether the issue is addressable.
Genuine and BVP together	Assess the combined offer and the appropriate application rather than treat every Genuine decline as lost business.	Protect combined contribution; distinguish new business from internal displacement.
Comparable competitor evidence	Assess selected prices at the correct commercial level, with product and pack equivalence established.	Reduce unnecessary concessions; test justified price changes against gross profit.
Case, decision and delivered support	Connect an approved Special Price Agreement (SPA) or other support to eligible parts and subsequent activity.	Measure contribution after support; avoid counting approvals or credits as new profit.
Agreed action and known outcome	Retain what changed and why a participant judged the response useful.	Reuse learning, reduce repeated preparation and stop ineffective activity.

Information that billing cannot supply

ISZE already knows what it billed to a distributor. It does not learn from that invoice alone whether a dealer faced a fitment issue, a competing quotation, a stocking decision or a lost contract. A short, attributed explanation can distinguish those cases. An outcome record can establish whether support was used. These are the new informational assets the product should create through useful work.

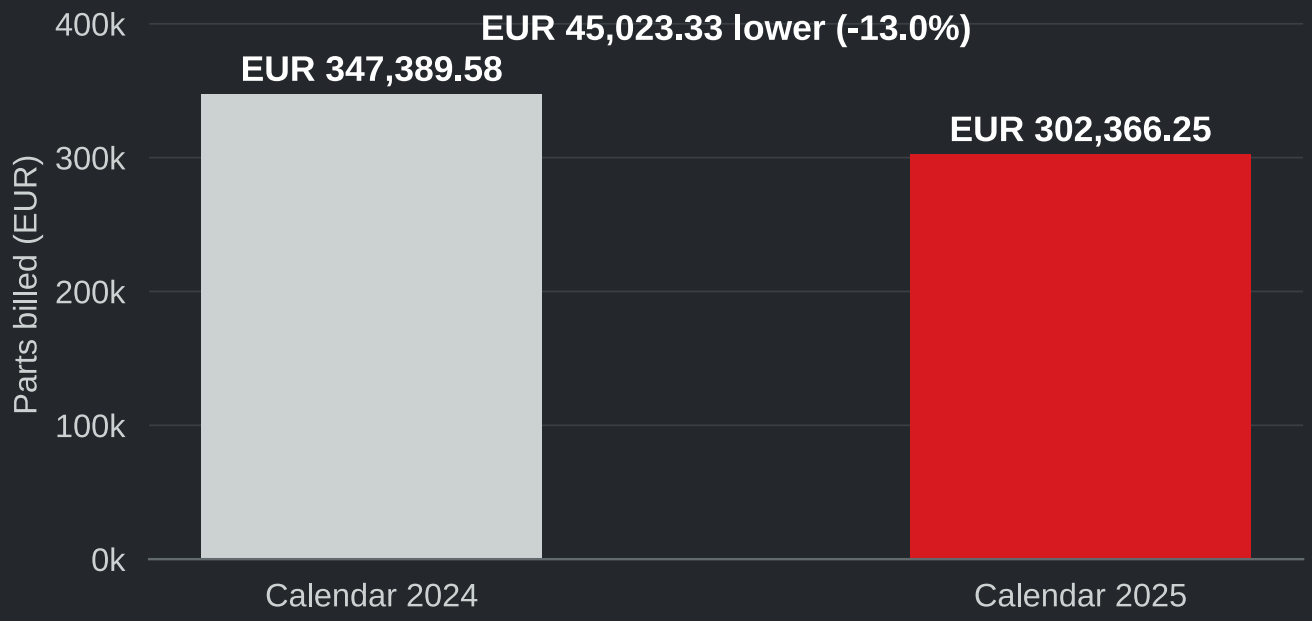

The first economic gains may be an avoided mistake or less preparation rather than additional sales. A commercial response may still be worthwhile when the correct result is no concession. Conversely, a visually convincing opportunity is not an economic benefit until the relevant parts, quantities, terms and outcome support it.

Sources: [W] pp. 8-10, 20-24, 30-39; [A] slides 10-18. Economic mechanisms are hypotheses to test [P], not measured Universe returns.

COMMERCIAL & PARTICIPATION REVISION

A real example: ITUK brake pads

EUR 45,023 less was billed in 2025 than in 2024; the useful next step is to establish which references and circumstances explain it.

Measured source-category billing: ISZE to Isuzu Truck UK (ITUK), brake pads, full calendar years 2024 and 2025. Source [M], supplied 19 September 2026; arithmetic checked 22 September 2026. This is distributor purchasing, not end-customer demand.

Recorded quantity fell from 4,562 to 3,402, a 25.4% reduction, while parts billed fell 13.0%. The difference is commercially useful because a revenue-only review understates the quantity movement. It does not prove a like-for-like price increase: different references, product mix and terms can change average revenue per recorded unit.

The relevant contextual fleet is 22,389 ITUK trucks on the supplied calendar-2025 spend-per-truck basis, using the DVLA March 2026 register. No dealer share of that fleet is assumed, and the count is not used to calculate the purchasing change. [F]

What the data should enable next

Use the approved part classification and original transacted references to identify the contributors. Then use a compatible sales-to-dealer source to locate the account pattern. Ask ITUK for the explanation of that selected pattern, not for every dealer to complete a new questionnaire. Check supply, prior stock purchases, account movements, supersession and BVP applicability before treating price as the cause.

THE COMMERCIAL POINT

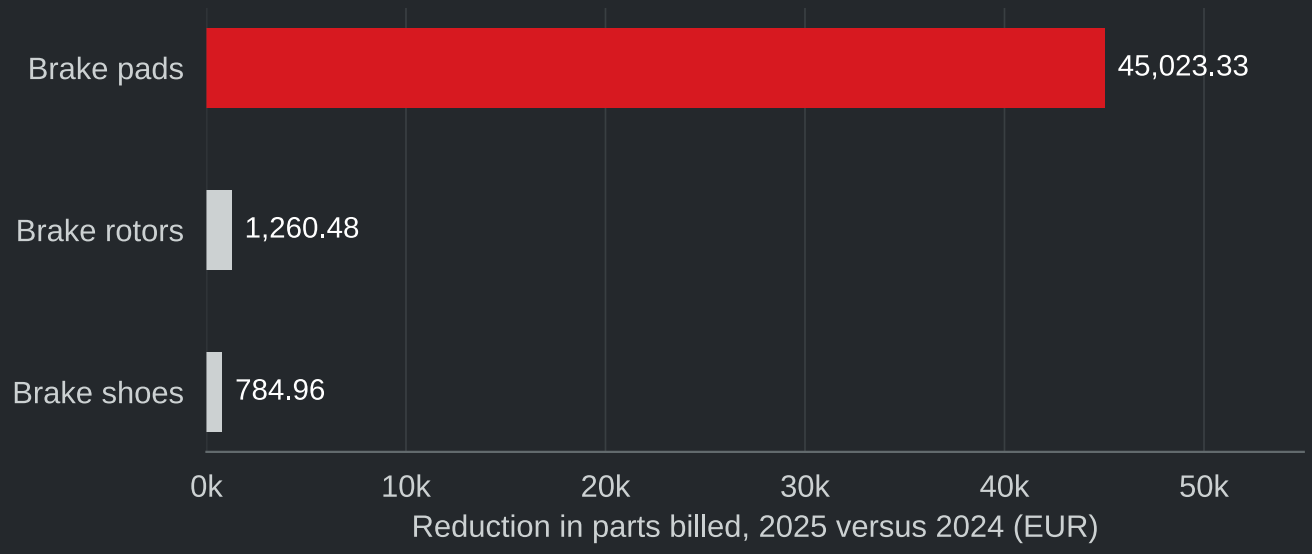

The supported finding is a purchasing change in a defined source category. The source summary does not establish the exact pad references causing it, a competitor sale or a justified discount. Those missing links are the point of the next commercial review.

Sources: [M]; [A] slide 11 and notes; [N] sections 5 and 7; [F]. Original source exclusions retained. No new part-family certification or price recommendation is asserted.

COMMERCIAL & PARTICIPATION REVISION

The data can concentrate the commercial effort

Brake pads explain 95.7% of the reduction across the three selected ITUK braking categories.

Measured changes in ISZE parts billed to ITUK, CY2025 versus CY2024: selected brake-pad, rotor and shoe source categories only. Positive bar length shows the magnitude of the reduction, not growth. Source [M]; calculation checked 22 September 2026.

The three categories declined by EUR 47,068.77 in total. Brake pads account for EUR 45,023.33 of that change; rotors account for EUR 1,260.48 and shoes for EUR 784.96. This is not the complete AIM Brakes family. The fleet context remains 22,389 ITUK trucks on the stated spend-per-truck basis, not an application-specific denominator. [M; F]

A quantified decision exposure, not a claimed saving

Suppose a commercial response reduced net prices by 5% across the same pad purchases represented by the 2025 EUR 302,366.25 billing base, with quantity, mix and unit costs held unchanged. The mechanical reduction in revenue and gross profit would be **EUR 15,118.31** before any demand response or other cost change. This is a static illustration, not an existing offer, a forecast or a realised saving. [C]

Better information is valuable if it shows that a concession should be narrower, replaced by a supply action or not made. However, the EUR 15,118.31 cannot be booked as an avoided cost unless a credible alternative decision and its eligible scope are documented. Nor can the historical EUR 45,023.33 reduction be described as revenue Universe will recover.

THE COMMERCIAL POINT

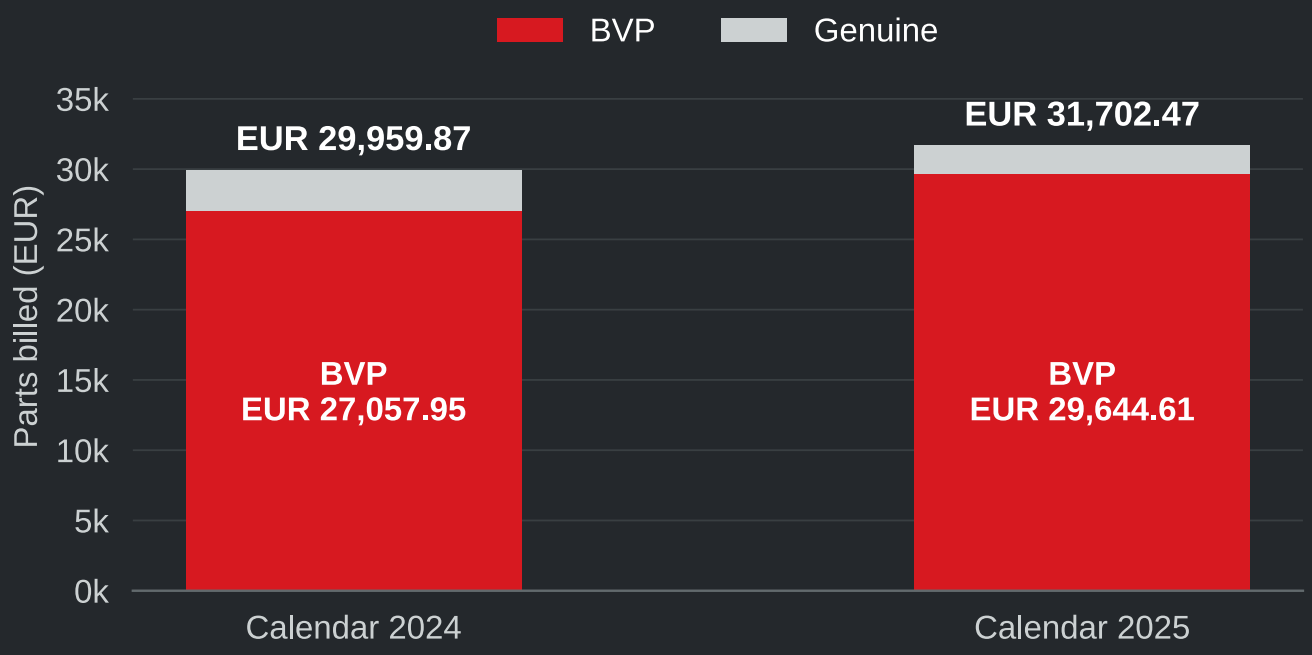

The immediate value is prioritisation: investigate the pad range first, then establish the cause and assess a selective response. Do not spread the same commercial remedy across products that have different explanations.

Sources: [M]; [A] slide 12; [F]. Conditional calculation [C]: EUR 302,366.25 x 5%, constant quantity/mix/cost; planning illustration dated 22 September 2026, not an ISZE result.

COMMERCIAL & PARTICIPATION REVISION

A real example: Portugal clutch kits

Combined Genuine and BVP billing increased, even though Genuine billing declined.

Measured product-line mix: ISZE parts billed to I Motors, Portugal, clutch-kit source category, full CY2024/CY2025. BVP means Best Value Parts. Source [M]; arithmetic checked 22 September 2026. This is not evidence of individual customer switching.

Genuine billing fell from EUR 2,901.92 to EUR 2,057.86. BVP billing rose from EUR 27,057.95 to EUR 29,644.61. Combined billing increased by EUR 1,742.60, or 5.8%, from EUR 29,959.87 to EUR 31,702.47. Recorded kits were almost unchanged: 462 in 2024 and 461 in 2025. Calculations use source precision; rounded component values may differ slightly from the printed total.

Portugal has 8,176 vehicles in the supplied calendar-2025 spend-per-truck context. That is market context, not a count of vehicles applicable to these clutch-kit references; it is not allocated to dealers. The separate target-spend model uses a different fleet basis, which is not mixed into this example. [F; N]

The decision changes when the range is read together

A Genuine-only view would invite a recovery discussion. The combined view first asks whether the current offer is appropriate and profitable. Review actual kit contents, applicability, supply and net contribution before increasing BVP promotion or changing Genuine terms. BVP is a product line and a kit is a product form; neither establishes a technical substitute by itself.

THE COMMERCIAL POINT

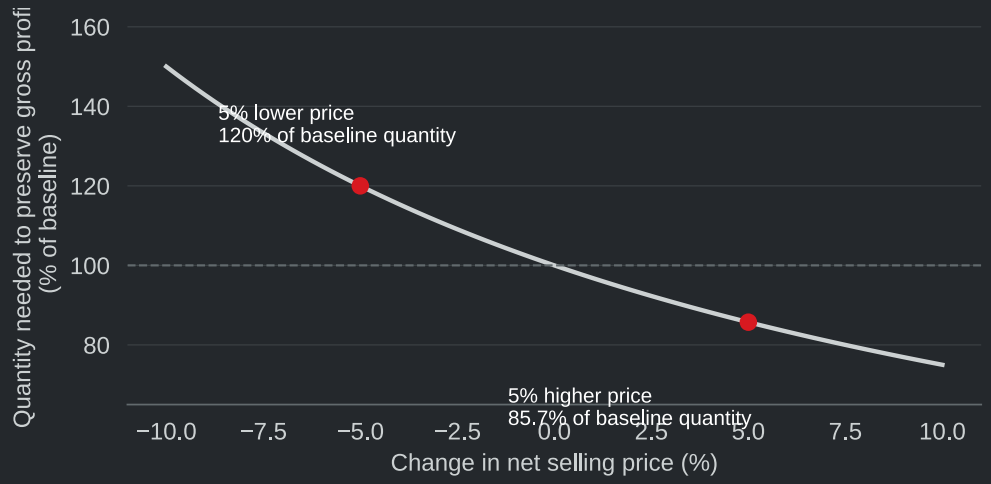

Universe should prevent a wrong diagnosis as well as find an opportunity. This example supports a better range discussion; it does not establish an increase in gross profit or quantify business won from competitors.

Sources: [M]; [A] slide 13 and notes; [F]; [N] sections 5 and 7. The national sales-to-dealer file does not support attribution to individual Portuguese dealers.

COMMERCIAL & PARTICIPATION REVISION

Test contribution before changing price

A lower price and a higher price both require a part-specific commercial case; the data supplied does not establish either as an approved action.

Illustrative unit economics, not ISZE prices or costs. Baseline net selling price EUR 100, unit cost EUR 70, gross margin 30%; unit cost fixed. Curve shows the quantity needed to preserve baseline gross profit, not an estimated demand response. [C], 22 September 2026.

Case	Evidence and proposed decision	Financial test
Price decrease: ITUK brake pads	CY2024/CY2025 distributor billing is lower. Exact contributors, comparable competing offers, stock/ supply and approved BVP matches still need validation. The account lead and commercial approver should assess selected references, not approve a general cut.	At the illustrative 5% lower price, unit gross profit falls from EUR 30 to EUR 25. Quantity must rise 20% to preserve gross profit. No such demand response has been measured.
Price increase: design case only	No specific market/part/period in the supplied evidence establishes underpricing. For a future selected reference, require current comparable offers, availability, customer relevance, aligned costs and a review period before nominating an increase.	At the illustrative 5% higher price, unit gross profit becomes EUR 35. 85.7% of baseline quantity preserves gross profit. This is an arithmetic threshold, not evidence that customers will accept the change.

For either direction, preserve original part identity and the actual sales stage. A distributor may assess its own prices and margins locally without providing those prices to ISZE. Compare alternatives on equivalent application, kit contents, pack size, currency, tax, delivery and observation date. ISZE net distributor prices and an online retail offer are not directly interchangeable.

The pilot must compare a stated baseline with the eventual result, considering timing, mix, supply and other actions. The relevant fleet is context until technical applicability establishes the eligible vehicle population. Where the part or population is unresolved, the price recommendation remains unresolved.

Sources: [W] pp. 20-25, 36-39, 50-51; [A] slide 14; [U2]. Numerical examples [C] use explicit invented planning assumptions only; no actual pricing recommendation or elasticity is claimed.

COMMERCIAL & PARTICIPATION REVISION

BVP action and no price change are distinct outcomes

The right response may be to improve the offer or correct the interpretation, rather than move the price.

BVP action: review the combined Portugal clutch-kit offer

Business question and basis. Isuzu-to-I Motors clutch-kit billing, full calendar 2024 versus 2025, shows combined growth while Genuine declines. Market context is 8,176 vehicles in the stated 2025 fleet basis. This does not identify dealer performance or kit-level interchangeability. [M; F]

What to check. Reconcile the original kit references and contents, establish the supported Genuine/BVP relationships and confirm supply. A technically equivalent competitor offer is not present in this case, and the combined billing change does not establish profit. Product mix, net price and ordering timing remain alternative explanations.

Proposed action. The I Motors parts manager and ISZE range lead should prepare an application-specific comparison and identify a genuine range or guidance issue before proposing promotion. Measure combined contribution and repeat purchasing for the eligible references. Deduct displacement from Genuine when assessing incremental BVP contribution. The existing EUR 1,742.60 billing increase is historical context, not a Universe benefit.

No price change: distinguish timing or supply from demand

Actual supporting observation. The June 2026 monthly-report account recorded in the operations context describes an ITUK monthly shortfall of EUR 159,000 against budget with EUR 165,000 in work in progress billed on 1 July. It is a reported timing explanation, not a part-family or dealer-level loss. No family allocation or recovery estimate is made from it. [O, section 3.5]

Proposed decision rule. Before using a monthly shortfall to justify lower prices, confirm the eligible orders, billing dates, supply position and whether the expected activity occurred. The account lead and supply or finance contact own that check. A timing explanation on this month does not explain the separate 2024-to-2025 pad-category movement.

> THE COMMERCIAL POINT
>
> The test of the product is whether it changes the decision appropriately. A supported decision not to discount can be a useful result, but its financial value is unknown unless the otherwise-expected concession is documented.

Both cases retain the same boundaries: no price-free quantity file becomes actual dealer revenue; no country fleet becomes a dealer denominator; no generic BVP relationship becomes fitment approval.

Sources: [M]; [F]; [A] slide 13; [O] section 3.5, June 2026 report as recorded in the 19 September 2026 context. Actions and measurement design are proposed [P].

COMMERCIAL & PARTICIPATION REVISION

Targeted support should leave an outcome record

A Special Price Agreement or tender response is more useful when the evidence, approved scope and result remain connected.

Design case. A dealer raises a live brake-pad quotation through ITUK. The historical 2024/2025 category movement can provide context, but the quotation itself needs its own current period, original part numbers, application, quantities and required date. No such completed quotation with outcome is established by the supplied paper. This is a prospective service case, not a reconstructed win. [W]

The dealer receives a response that advances the job: ordinary terms, a technically supported BVP option, a dated availability answer, a selected SPA proposal or a reasoned decline. The distributor retains the customer and national commercial relationship. ISZE approves only the support within its authority; it does not set the dealer resale price.

Evidence required	Why it changes the decision
Exact original part and approved application	Prevents a concession on a technically unsuitable comparison. A family label alone is insufficient.
Source-dated competing offer, where price is the issue	Makes product, tax, pack, currency, channel and delivery comparisons explicit. Missing evidence remains missing.
Eligible quantity, dates, net terms and aligned cost	Permits an ISZE gross-profit scenario and a clear approval scope.
Order or delivery link and customer outcome, when known	Distinguishes approved support, support used, parts billed and the actual outcome. These are different states.

The financial mechanism

Compare contribution on eligible activity with a defensible baseline, after the support and costs that are not already included. A lower unit margin may produce higher total gross profit at sufficient volume, but additional purchasing can also be stock replenishment or business displaced from another Isuzu offer. Use actual quantities and costs; do not assume downstream pass-through or customer price response.

The tender extension

A source-dated tender can begin the same sequence: relevant opportunity, decision to investigate, bid-support request, authorised response, submission and known outcome. A notice count is not a commercial pipeline value. An award is not parts billed, and later billing cannot be attributed to an award without a supported link.

> **THE COMMERCIAL POINT**
>
> The case owner keeps the request together. The commercial approver decides terms; the technical function decides application; the source owner confirms supply. The result may be a useful answer with no concession and no known customer outcome.

Sources: [W] pp. 20-22, 29-31, 36-39; [R] pp. 19, 23. Fifth commercial case: proposed [P]. No supplied evidence supports retrospective conversion or incremental profit for this case.

COMMERCIAL & PARTICIPATION REVISION

A tangible return for the distributor

The distributor should receive work it can use with its own team and dealers, without paying twice for an existing reporting obligation.

Returned work	Frequency or trigger	Decision it supports
Prepared national or dealer-network review	Proposed monthly, after a usable submission. Preserve the actual covered level.	Which account and part family merit attention, and which movements are explained by coverage or timing.
Original parts behind a selected movement	Within the review, subject to an accepted classification.	Which references to investigate rather than apply support to a broad category.
Genuine/BVP and comparable market evidence	For the selected application or commercial question.	Whether range, guidance, availability or commercial terms should change.
Relevant fleet and dealer-assessment context	When its period, population and identity are established.	Whether a comparison is fair and which agreed practice merits support.
A prepared commercial-support or tender case	When a real opportunity requires a decision.	What support to request, what was approved and what remains unresolved.
Action and response history	Updated as the work happens; reviewed in the next conversation.	Who owes the next step and whether the previous commitment was delivered.

This is not a second copy of the distributor enterprise system. The extra contribution from ISZE is a common product language, relevant vehicle context, technical and supply knowledge, and access to an accountable commercial response. Where the distributor already performs an analysis well, Universe should reuse the result or add the missing context instead of demanding duplicate preparation.

The distributor should choose which dealer questions are worth taking forward. It should also see whether the burden falls on an administrator while the benefit goes to a manager. An extract definition, reusable mapping and a single correction route help the person doing the work, not merely the person receiving the report.

> **THE COMMERCIAL POINT**
>
> A cooperative distributor is not necessarily technically ready, and a technically successful upload is not evidence of continued use. Record willingness, source readiness, effort and commercial usefulness separately.

Sources: [W] pp. 9-10, 18-24, 32-36; [U2]. Frequencies and returned services are proposals [P], not existing universal service commitments.

COMMERCIAL & PARTICIPATION REVISION

The dealer needs its own reason to participate

Begin with useful help at the parts counter or in a review, not with another data request.

Understand my own pattern

A short, relevant review of recorded purchasing, the exact references when supported, and a correction route. The dealer can say that the interpretation is wrong or no action is needed.

Resolve this parts question

A supported application, Genuine/BVP or availability answer for a real job, returned through the distributor without retyping the entire request.

Follow the help we agreed

A visible response or action, including support owed by ISZE or the distributor. The dealer can see when it is waiting on someone else.

Dealer participation does not have to mean a direct recurring upload. Where the distributor already supplies account-level purchasing, the dealer can participate by checking one observation, adding a local explanation, choosing an action or confirming an outcome. National-only information is not represented as a personalised dealer history.

Make the return visible to the person doing the work

The parts counter needs an answer that moves a quotation or application question forward. The aftersales manager needs a short review and a useful follow-up. The dealer principal needs confidence that the information will not become an unsupported performance ranking or a route around the distributor. The same service may therefore need a concise case response and a more detailed management view, with the same underlying evidence.

The dealer normally sees its own permitted review, its own assessment context and the relevant response. It does not receive ISZE cost data, another dealer's identifiable commercial results, another distributor's terms or unrestricted internal notes. Additional sensitive details are requested only for the case that needs them, with the audience explained.

> **THE COMMERCIAL POINT**
>
> The continuing reason to participate should be practical: a quicker supported answer, a more accurate commercial discussion, less repeated explanation and reliable follow-through. Recognition can reinforce this; it cannot replace it.

The dealer offer should remain usable without a portal account during the first controlled pilot. A distributor-led review and a properly restricted response can test value before external multi-user software is justified.

Sources: [W] pp. 9-12, 19-25, 32-35, 43-46; [U1-U2]. These dealer services and participation behaviours are proposals to test [P].

COMMERCIAL & PARTICIPATION REVISION

Onboard around the first useful task

The first invitation should open prepared work, not an empty portal.

A **Prepare**
Use the distributor information already held. Select a real question and remove irrelevant or unsupported findings.

B **Confirm**
The dealer checks the account, the question and its relevance. A correction or no-action answer is acceptable.

C **Return**
The responsible function provides the answer, the agreed investigation or the precise unresolved issue.

D **Follow through**
Record the decision, support delivered and outcome when known. Avoid another reporting form.

E **Repeat**
Offer the next relevant review or task, reusing the previous context. Observe whether the dealer chooses to return.

A proposed effort limit to test

Use a ten-minute first-review task as a usability test, not a promised processing time. The dealer should be able to understand the selected observation and either correct it or choose a next step in that time. More complex commercial or technical work is scoped separately. Record actual effort, including preparation and correction; do not claim a saving because difficult cases were omitted.

A dealer with no relevant task in a period should not be classified as inactive. A dealer that declines an optional workshop export may still be a regular and valuable user of the core service. Participation measures should follow the jobs the person can reasonably perform, not a daily-login expectation.

Make the early sample informative

Invite different working conditions rather than only enthusiastic, technically capable dealers. Include a dealer that needs a parts answer, one with a valid purchasing question and one that is reluctant to add reporting work. These are selection principles, not a confirmed participant population. The distributor chooses appropriate invitations and the actual audience is approved before anything is shared.

> **THE COMMERCIAL POINT**
>
> The test is whether the useful task survives ordinary work pressure. A polished demonstration with invented dealer data cannot establish that.

Sources: [W] pp. 32-35, 43-44, 53-57; [U2]. Journey, sample principles and ten-minute test are proposed design assumptions [P], dated 22 September 2026.

COMMERCIAL & PARTICIPATION REVISION

Fund the cost of starting, not the volume of disclosure

Additional dealer support should remove a practical obstacle to useful participation and have a defined end.

The distributor KPI-linked rebate and a new dealer enablement programme serve different purposes. The existing obligation should not attract a second distributor payment merely for submitting the same report. A dealer may, however, need help setting up an agreed workflow, attending a relevant training session or completing a co-funded improvement. That activity can have a defined deliverable and cost. [U1-U2]

Possible use	What qualifies	What does not qualify
Capped setup assistance	A documented task that makes the agreed review or case exchange usable. Accepted once; scope and cost recorded.	A payment per uploaded file, per row or per additional sensitive field.
Targeted practical enablement	Training or an improvement activity tied to a dealer task and a stated outcome.	A prize for an inflated self-assessment or the largest sales total.
Time-limited continuation support	Only where an approved experiment tests a specific barrier to repeat use. Terms are disclosed in advance.	An indefinite subsidy for logging in or supplying explanations regardless of truth.

The proposed dealer-enablement envelopes are EUR 15,000 within the EUR 100,000 route and EUR 100,000 within the EUR 300,000 route, over the first 12 months, ex VAT. They are maximum planning allocations, not promised payments. Eligible dealers, activity costs and approval terms are not supplied. No fixed payment per dealer is therefore assumed. [U2]

The exit test

Keep the ordinary service available when the additional support ends. Observe the next two eligible review or case cycles as a proposed test of continued use. Record whether the dealer returns, what it uses, the effort incurred and why it stops. Do not remove ordinary support or change the established distributor rebate simply to manufacture an adoption experiment.

> THE COMMERCIAL POINT
>
> Cost per retained active dealer = actual eligible adoption expenditure / dealers that continue meaningful use in the defined observation period. Report zero retained dealers as no demonstrated retention, not as a zero cost. Keep the eligible population and observation period visible.

Sources: [U2] proposed funding allocations and incentive principles; [W] pp. 10, 36-44. The two-cycle exit test is proposed [P]. No adoption rate, dealer count or subsidy commitment is established.

COMMERCIAL & PARTICIPATION REVISION

Recognition should follow a useful improvement

An award may support professional pride and peer learning, but it should not become the product.

A working proposal is **Isuzu Parts Improvement Recognition**: acknowledgement of a documented improvement, a useful correction or a transferable practice developed with the distributor. The name, branding and any public use would need corporate approval. Recognition is not described as an existing programme. [U2; P]

Recognise	Evidence to retain
A relevant improvement implemented	The original problem, the agreed action, the support delivered and what changed against the participant's own stated baseline.
A correction that improves a decision	The corrected record, its scope and the decision it changed, even when the correction reduces the apparent opportunity.
A practice that another participant can use	A reviewed, non-confidential explanation with its application and limitations.
Sustained useful participation	Repeated relevant work and returned value, not simply submission compliance or time spent in the interface.

Avoid a public dealer league table. Raw turnover favours large businesses; self-assessment scores have different coverage and do not measure commercial outcomes. Upload counts favour administrative activity. Sensitive disclosure should never improve a participant's standing. Where comparison is necessary, use a stated task or cohort and improvement against the participant's own baseline.

A workable low-cash form

The owner-built option can use an approved written acknowledgement and a short peer-learning example in an existing meeting. It should not assume that travel, new events, physical awards or staff administration are free. A dealer should be able to decline publicity without losing the service. Contributions require review, a correction route and an opportunity to challenge an incorrect account of the result.

Recognition is most persuasive when the participant can explain the benefit without mentioning the award. If the only reason to supply information is a badge, Universe has not yet demonstrated a sustainable commercial exchange.

> **THE COMMERCIAL POINT**
>
> The standard is credible improvement and useful learning. No payment, award or status should reward an unsupported claim of recovered sales.

Sources: [U2] recognition requirements; [W] pp. 10-12, 43-46. Programme design and proposed title are [P]; official status and public consent are not assumed.

COMMERCIAL & PARTICIPATION REVISION

Keep the recurring exchange price-free

Agree the meaning once, reuse existing exports and return only the exceptions that need correction.

Information	Minimum usable definition
Distributor	A stable identity for the actual commercial entity. Do not blend the two UK distributors or the two Israeli distributors.
Purchasing account	Stable source dealer/account identity where available, original name and an approved relationship. National-only sources remain national.
Original part number	Retain the transacted identity as text. A newer number or classification is an additional relationship, not a silent replacement.
Period and quantity	The reporting month or transaction date, the event it represents, quantity and unit. Keep calendar and fiscal periods distinct.
Returns and corrections	Distinguish positive activity, returns and revisions; state the treatment before comparison.
Coverage	Included accounts, channels, products, transaction types and missing or provisional months. Explicitly state whether wholesale activity is included.
Submission and control	Extract date, version, the version replaced, comparable control totals and the source owner for questions.

Monthly is the proposed operating cadence for the commercial review. The actual reporting calendar and due date should be agreed within the existing arrangement, not invented as a new contractual term by the paper. The owner's 20% rebate clarification does not establish every field or deadline of the original KPI requirement.

The required information does not include distributor or dealer selling prices, margins, customer identities, vehicle identification numbers, full stock files or workshop job cards. Where only quantities are supplied, the service can analyse recorded purchasing, product mix and recurrence. It cannot calculate actual downstream revenue or gross profit from those quantities alone.

A correction should replace, not multiply

A revised monthly submission identifies the earlier version it replaces. The earlier evidence remains traceable, but both are not added together. Re-importing the same file must not create more activity. Annual control rows are reconciled separately from monthly observations, and combined accounts remain combined until the source supports a genuine split.

> **THE COMMERCIAL POINT**
>
> A distributor should not receive repeated requests for definitions it has already supplied. A new question is justified by a changed source, a real exception or a new decision — not by a different ISZE team asking again.

Sources: [W] pp. 32-36, 62-64, 75-77; [R] pp. 35-38; [U1-U2]. This is a proposed service standard, not a restatement of uninspected contractual wording.

COMMERCIAL & PARTICIPATION REVISION

Earn additional detail one useful service at a time

The optional contribution should make the next answer better, while unrelated services remain available without it.

Optional contribution	Return to the participant	New understanding for ISZE
A short local explanation	A fairer review and a response aimed at the real issue.	Whether the selected movement concerns supply, application, timing, competition or another reported circumstance.
A source-dated competing offer	A properly scoped price or support assessment.	Comparable positioning on the actual product and commercial level, not an assumed market index.
Application details for a selected part	A technical answer with conditions and a usable reference.	Which product relationship or guidance needs attention; not automatic evidence of a product defect.
A dated stock or open-order observation	An agreed supply or range study for those parts.	A way to distinguish a documented availability issue from purchasing silence, within the stated coverage.
A defined service population or selected workshop evidence	A scoped service analysis on an applicable technical basis.	Relevant exposure and recorded work; not the entire dealer fleet or all end-customer demand.
An outcome or locally calculated benefit	A reusable record of what the response achieved.	Whether the action was used and what can be evidenced without demanding the participant's full margin file.

Each request should state the case, the smallest adequate contribution, its audience, the use, the returned work and the narrower answer available if it is declined. A local aggregate or redacted statement can be sufficient. A selected stock snapshot does not authorise a permanent inventory feed; a vehicle detail for an application check does not belong in every commercial view.

The product should create its own response dates, action states and approval references. It should not ask a participant to fill in information that the service already generates. A contributor's statement remains attributed until corroborated; an unknown outcome is acceptable.

> **THE COMMERCIAL POINT**
>
> The quality of the exchange is measured by better decisions per unit of effort, not by the number of additional fields collected.

Sources: [W] pp. 30-36, 63-68; [U2]. All optional exchanges are proposed [P] and remain subject to source-specific permissions and actual service capacity.

COMMERCIAL & PARTICIPATION REVISION

A broad offer, with a narrow first release

Keep the eight services visible, but open each only when its smallest useful response can actually be delivered.

Service	First useful return	Boundary or next dependency
Connected review	A prepared purchasing observation, contributing references where established and one agreed decision.	ITUK can support named-account history; Portugal starts nationally. Current data needs a current compatible submission.
Quotation and commercial support	A scoped response through the existing approval route.	No historical won/lost record is established. Start new records prospectively.
Availability, range and selected stock	A dated supply answer or narrower range discussion.	Purchasing is not stock. A stock study needs a separately agreed observation.
Application and Genuine/ BVP guidance	The supported part relationship and, where authorised, an application answer.	Classification, catalogue pairing and supersession are not fitment approval.
IDS improvement follow-up	An agreed action with dealer work separated from help owed by others.	Self-assessment remains self-assessment. Action completion does not change the score.
Fleet and workshop support	A descriptive or modelled analysis of a defined population.	A workshop extract is not the full dealer fleet; currency and population must be established.
Tender and fleet opportunity	A relevant sourced opportunity and a prepared support case.	A notice or award is not parts revenue; outcomes need their own record.
Explanations and commercial memory	A retrievable observation, explanation, decision and outcome.	The service creates this record from its start. Billing cannot reconstruct missing reasons.

The initial pilot should combine a prepared review, a relevant parts question and the short decision record. Deeper stock, workshop, tender and connected-vehicle functions should be added only for a real task. This preserves the broad product proposition without making every source and every integration a launch condition.

An approved existing answer may resolve the task without creating a new case. A case is needed when a decision remains unresolved or a commitment needs follow-through. More cases are not automatically more value.

Sources: [W] pp. 18-31, 59-61; [R] pp. 18-24. Service catalogue retained; first-release selection and prospective operating sequence are proposed [P].

COMMERCIAL & PARTICIPATION REVISION

ISZE must become accountable for the return

Asking for relevant information creates an obligation to provide a relevant response.

The service should identify one participant-facing case owner, the function responsible for the substantive answer and a deputy or escalation route. Existing commercial and ownership arrangements are not reopened by this paper. What must become explicit is who accepts the particular task, on what authority and with what available time. [W]

Responsibility	What the participant should experience
Receive and direct	The question is understood, its scope is clear and any established urgent procedure is used rather than delayed by the new workflow.
Answer within authority	A technical, supply or commercial answer states its basis, conditions and unresolved points. A request for unrelated extra data is not an answer.
Maintain continuity	The case owner consolidates information requests and preserves the history when the responding function changes.
Follow through	The dealer can distinguish what it owes from what the distributor or ISZE owes, and can see the next agreed update.

Timing must be credible before it is promised

Record submission, assignment, substantive answer and resolution separately. An acknowledgement is not the substantive answer. Internal reassignment must not reset total waiting time. If an input or external authority prevents a conclusion, identify the missing decision and agree the next update with the participant. The actual response window depends on the service and the responsible function's approval.

The supplied roadmap contains proposed response windows, not accepted service guarantees. This revision does not convert them into commitments. For a controlled pilot, each accepted live case should have a named owner and an actual next-update date; a broad network-wide response promise can wait for workload evidence.

Capacity grows with real work, not page views

Track new relevant requests, source preparation, correction, specialist handling, coordination and rework. If responses are not arriving, narrow the offered scope before inviting more participants. Self-service guidance and reuse can reduce the burden, but the owner must not become a permanent manual support desk for every function.

> **THE COMMERCIAL POINT**
>
> A participant that supplies the requested context and receives no useful response has learned that the exchange costs more than it returns. The response obligation is therefore part of the product, not an optional support layer.

Sources: [W] pp. 39-44, 76-77; [R] pp. 42-48. Response classes are specified in the source; live assignments, capacity and service windows remain operational decisions.

COMMERCIAL & PARTICIPATION REVISION

Trust should be visible in the working experience

The participant should understand what is shared, why it is needed and who can use it.

The existing distributor relationship remains the channel for the service. Core reporting, a joint commercial case and an optional workshop study are different information uses. General cooperation is not treated as consent to every new use. The actual contractual, privacy, competition and corporate-policy position must be checked by the responsible functions for the selected service, not assumed from the manufacturer's role. [U1; W]

Information	Proposed normal audience	Limit
Dealer purchasing review	Relevant distributor roles and the dealer's own permitted view.	No access to another dealer's identifiable commercial results by changing a filter.
Sensitive quotation or stock detail	The people assessing the specific case.	No automatic cross-distributor sharing or reuse for a different commercial purpose.
ISZE costs and confidential terms	Authorised ISZE commercial and finance roles.	Not included in general dealer outputs or product reference information.
Dealer assessment and agreed action	Dealer and authorised review roles.	No distributor audit score; no hidden penalty for waiting on promised support.
Reusable technical guidance	Approved broader audience after review.	Application, source currency and confidentiality checked before reuse.

A file intended for one distributor must contain only information that distributor may receive. Hidden tabs, disabled menus and a preselected filter do not protect data already included in the file. The owner-built route can remain internal, with separately prepared controlled outputs, until a supported external access arrangement exists.

A correction should preserve the original observation and the decision made at the time, while showing the corrected interpretation. A participant stopping an optional feed should not automatically lose its permitted historical response record. Retention, export and departure rules must be explicit for the record type; there is no universal retention period invented here.

> THE COMMERCIAL POINT
>
> Universe should support a legitimate bilateral commercial assessment, not prescribe resale prices or circulate another participant's sensitive future terms. These are proposed product boundaries, not a legal clearance opinion.

Sources: [W] pp. 44-49, 68-69, 76-77; [U1-U2]. No new legal entitlement, contractual obligation or operational permission is asserted.

COMMERCIAL & PARTICIPATION REVISION

Preserve the distinctions that change the answer

Commercial clarity depends on not turning different observations into one apparently precise result.

Evidence	What it can establish	What it cannot establish alone
ISZE parts billed	Distributor purchasing on the stated billing basis.	Customer demand, what was fitted or why a dealer bought elsewhere.
Sales to dealer	Recorded downstream purchasing at the actual supported account level.	End-customer sales, complete inventory or actual downstream revenue when prices are absent.
Historical fleet and technical schedule	Context or a modelled expectation for a defined applicable population.	Realised market demand, a dealer allocation or a forecast beyond the usable historical fleet.
IDS self-assessment	What a dealer reported in the stated round or questionnaire.	A distributor audit, measured causality or improvement inferred from closing an action.
Warranty	Recorded claims, defects or settlements under that source definition.	Scheduled maintenance, filter replacement or proof of insufficient dealer servicing.
Part relationships	Classification, a catalogue pairing or supersession on its stated authority.	Unconditional interchangeability or approved fitment.
Participant explanation	A reported reason scoped to the relevant part, period or case.	A causal allocation of the entire family change without supporting evidence.

Keep Isuzu Truck UK (ITUK) separate from Isuzu UK (IUK), the light-commercial distributor. Keep Universal Motors Israel (UMI) separate from Universal Trucks Israel (UTI). UTI did not participate in the 2026 dealer-standards round and must not be averaged into that population. Billing has no inherent vehicle-identification or model attribution: only validated exclusive applicability permits a measured model or weight-band purchasing view. Shared-applicability parts remain shared, not allocated by fleet proportions.

Use one reporting clock at a time. The approved numerical context uses billing through 30 June 2026, so its 2026 figures are a half year. Later source horizons described in the roadmap do not silently update this basis. This paper uses full 2024/2025 category comparisons and no unsupported fleet forecast.

> **THE COMMERCIAL POINT**
>
> Every quantified opportunity needs its euro basis, part family and applicable fleet or exposure. Without them, show a descriptive observation or a question. Do not publish an aggregate euro service-demand gap or multiply one by an arbitrary recovery percentage.

Sources: [N] and [O], as of 19 September 2026; [W] pp. 28-29, 50-51; [U2]. Specific source conflicts and editorial treatment are documented in the companion review.

COMMERCIAL & PARTICIPATION REVISION

Quantify the possibilities without inventing the return

The financial case should move from an eligible decision to measured contribution, with programme costs counted once.

Benefit mechanism	Calculation on the relevant basis	Evidence still required
Better-targeted price or SPA support	Gross profit under the actual supported terms minus a documented comparable baseline.	Eligible parts, aligned cost, quantities, net terms and a credible alternative decision.
Appropriate Genuine/BVP offer	Change in combined contribution after support, less displacement within the Isuzu offer.	Approved applicability, comparable period and actual eligible activity.
A recovered or retained quotation	Contribution linked to the case, with the otherwise-expected outcome separately evidenced or labelled uncertain.	Case-to-order link and outcome; a later invoice alone is insufficient.
Less repeated preparation	Old total effort minus new submission, correction, review and follow-up effort.	A comparable task baseline and actual time observations.
Better range or supply decision	Documented avoided cost or additional contribution for the actual affected scope.	Dated availability/stock evidence and the implemented decision, not a billing difference.

A unit of benefit that management can understand

On any genuinely affected EUR 1 million of parts revenue, one percentage point of gross margin is EUR 10,000 of gross profit, holding that revenue basis constant. This arithmetic illustrates materiality; it is not a proposal that Universe will improve the whole business by one point. Similarly, ten comparable reviews that each release one hour return ten hours of capacity. Their cash value remains unknown unless expenditure actually changes. [C]

The financial account should record one action once, even when AIM, PRISM, IDS and an SPA all helped it. ISZE support is a cost to ISZE and may reduce a participant's purchase cost; it is not automatically new network profit. A credit already included in net price must not be added again.

THE COMMERCIAL POINT

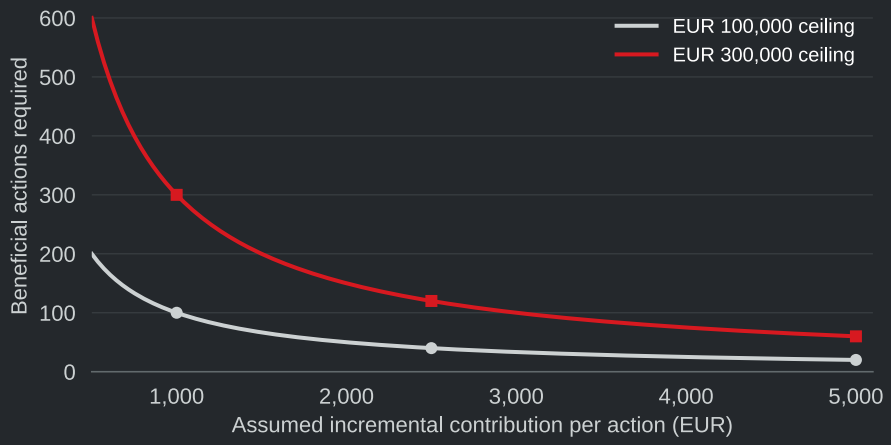

Net programme benefit = evidenced incremental contribution from non-overlapping actions − actual programme cash spent − incremental internal effort valued on an agreed basis − additional operating cost not already included. Unspent reserve is not expenditure. Do not deduct an incentive twice because it appears in both a case and the programme budget.

Sources: [W] pp. 36-39, 66-68; [U2]. Materiality examples and formula [C/P], 22 September 2026, are arithmetic illustrations; actual Universe benefit is not established.

COMMERCIAL & PARTICIPATION REVISION

What the investment would need to earn

Break-even is a requirement to test, not a forecast of how many successful actions the programme will produce.

Planning sensitivity for the first 12 months: full external cash ceiling divided by assumed incremental contribution per beneficial action. Actions are non-overlapping; contribution is after action-specific support not already charged to the programme. The chart excludes additional internal and out-of-envelope costs. [C/P]

Assumed contribution per beneficial action	Actions for EUR 100,000	Actions for EUR 300,000
EUR 500	200	600
EUR 1,000	100	300
EUR 2,500	40	120
EUR 5,000	20	60

The assumptions are not estimates of dealer profitability or proven ISZE gains. They show the scale of evidence needed. At EUR 2,500 per beneficial action, the full EUR 100,000 envelope requires 40 such actions before additional internal costs; the EUR 300,000 envelope requires 120. The increase from one total envelope to the other is EUR 200,000, equivalent to a further 80 actions on that same assumed basis.

The economic hurdle is higher when incremental internal effort or continuing costs sit outside the envelope. It is lower when less than the ceiling is actually spent. Report the cash-only comparison and the fully costed comparison separately. Capacity released is not used to claim that an external invoice has been recovered unless there is an evidenced cash effect.

THE COMMERCIAL POINT

Before funding expansion, measure how many eligible actions occur, how many are implemented, how many have an observable outcome and how much incremental contribution can actually be supported. Do not fill those unknowns with an assumed market-recovery rate.

Sources: [U2] alternative funding envelopes; [W] pp. 36-39, 43-44. All contribution values and resulting action requirements are explicitly hypothetical calculations [C], dated 22 September 2026.

COMMERCIAL & PARTICIPATION REVISION

Three routes to the same commercial product

Funding changes scale, support and repeatability; it must not change the standard of evidence or confidentiality.

Route	What it means in practice	Main trade-off
EUR 0 additional external cash	Owner-led internal decision product, controlled monthly inputs, prepared distributor outputs and dealer feedback through the distributor. Use only existing authorised tools and capacity.	More manual preparation, limited participant breadth and greater dependence on the owner. Existing licences and internal time still cost money.
EUR 100,000 focused option	Owner-led core plus defined specialist work, data-quality support, a controlled dealer enablement experiment and independent assurance.	A credible bounded pilot, not every European integration or a permanent outsourced team.
EUR 300,000 total option	The same core with more dealer enablement, onboarding and quality support, selected additional engineering and stronger operating resilience.	Wider participation still needs evidence, staffing and permission. The ceiling does not guarantee full European deployment.

One common planning basis

All three are alternative incremental external cash envelopes for the **first 12 months from approval**, a planning assumption rather than a committed calendar. They are not cumulative budgets. The move from EUR 100,000 to EUR 300,000 adds EUR 200,000 to the total ceiling, not another EUR 300,000. None is an approved expenditure or supplier quotation. [U2]

The allocations exclude recoverable VAT. Any non-recoverable VAT must be included within the authorised cash ceiling or returned for an explicit revised decision. Existing licence costs, internal hours and any operating cost outside the first-year envelope must be stated separately. A hosting allocation in the first year does not fund indefinite operation.

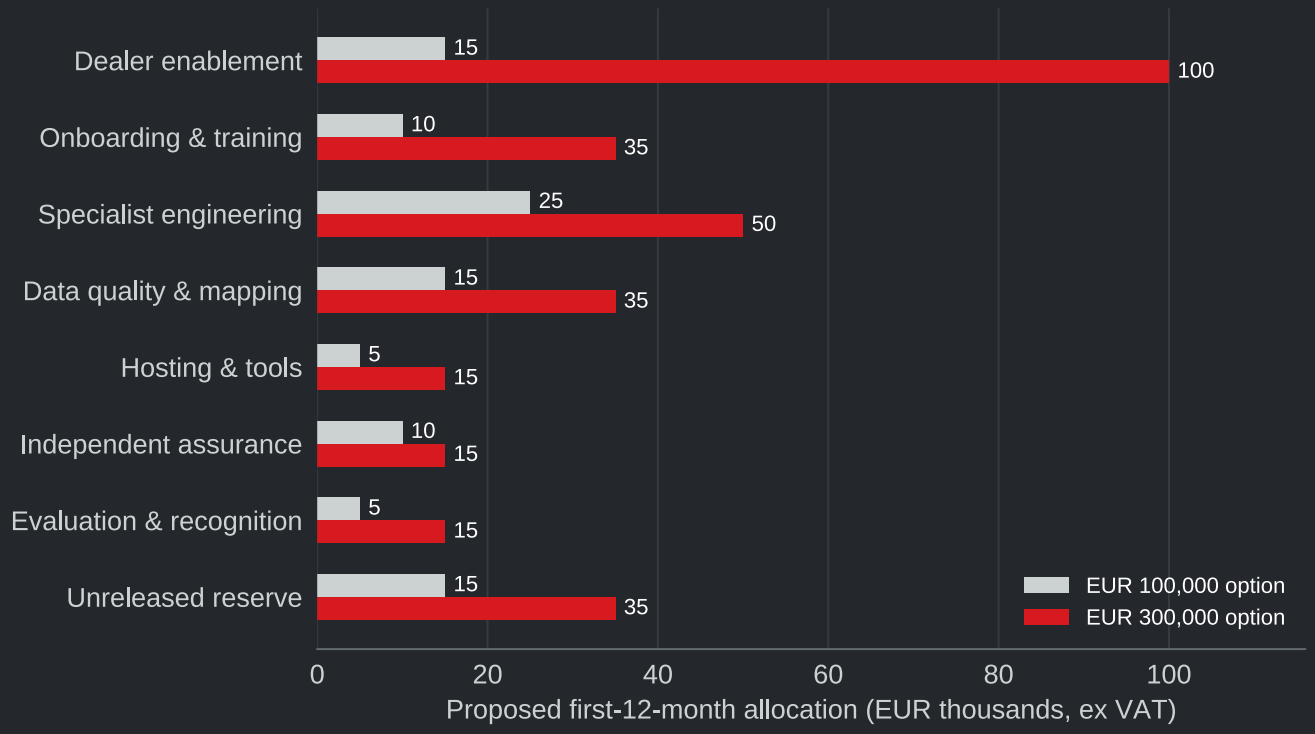

> **THE COMMERCIAL POINT**
>
> Start with the owner-led core and a conditional EUR 100,000 ceiling. Use the EUR 0 route when no new cash is approved, with its genuine scope limits. Consider the EUR 300,000 total only when the dealer-return and operating evidence show what the additional EUR 200,000 would buy.

Sources: [U2] funding requirements; [W] pp. 39, 53-54. Recommended choice, horizon and VAT planning treatment are proposals [P]. No procurement or accounting treatment is approved by this paper.

COMMERCIAL & PARTICIPATION REVISION

Fund deliverables, not a platform label

The proposed allocations keep dealer participation prominent and specialist software work bounded.

Proposed first-12-month external cash allocations, EUR thousands, excluding recoverable VAT. Alternative total envelopes, not actual expenditure or supplier quotations. Source [U2]. Both totals and the EUR 200,000 difference were checked on 22 September 2026.

The owner-built route has no additional external allocation in these lines. It does not have zero effort: source preparation, review, response, maintenance and access controls still need authorised internal capacity. No paid external subscription is assumed to be free.

Within the larger option, EUR 100,000 is reserved for dealer enablement and EUR 35,000 for onboarding and training. These are different activities: enablement supports an eligible dealer task or improvement; central onboarding covers invitation, instruction and launch support. An invoice or activity cannot be charged to both.

THE COMMERCIAL POINT

An allocation is permission to consider a defined category of work, not a reason to spend it. Unneeded engineering, incentives or reserve remain unreleased.

Source: [U2] initial budget allocation, retained without reallocation. Interpretation and release discipline proposed [P]. A detailed deliverable and acceptance table follows.

COMMERCIAL & PARTICIPATION REVISION

What each funding line should purchase

Every purchase needs a problem, an accepted deliverable and a recoverable handover.

Allocation	EUR 100k / 300k	Deliverable and acceptance
Dealer enablement	15,000 / 100,000	Capped, approved setup or improvement activity for a defined dealer task. Evidence of delivery and the later eligible-use test; no payment for data volume.
Onboarding, training and launch	10,000 / 35,000	Reusable instructions, role-appropriate induction and a prepared first task. A participant completes that task without repeated entry.
Targeted specialist engineering	25,000 / 50,000	Accepted work on the specific access, repeatability, context or recovery gaps the owner cannot safely cover. No open-ended platform outsourcing.
Mapping, validation and quality	15,000 / 35,000	Reviewed identity and source definitions, reconciled control totals and correctable exceptions. Joins do not multiply activity.
Hosting, approved tools, monitoring, backup	5,000 / 15,000	Only authorised services required by the selected delivery route. Dated cost basis, tested restore and a continuing-cost owner.
Independent assurance	10,000 / 15,000	A reviewer independent of implementation tests access isolation, exported content and the actual information-use design. Remediation is tracked.
Evaluation and recognition	5,000 / 15,000	Comparable task baselines, outcome review and approved recognition administration. No unsupported financial-impact claim.
Contingency and unreleased reserve	15,000 / 35,000	A documented exception with owner approval. Unspent amounts remain unspent; no routine activity automatically draws on the reserve.
Total external ceiling	**100,000 / 300,000**	**First 12 months; proposals, ex recoverable VAT. Internal time and later operating costs are separate.**

An engineering supplier may implement access controls; the independent assurance line evaluates them. That is not the same deliverable. Data-quality support handles source meaning and relationships; engineering handles the accepted technical behaviour. Evaluation measures outcomes rather than repeating either contract.

Eligible dealer numbers are not established. The dealer-enablement allocation is therefore planned as the sum of accepted eligible activity costs, subject to the ceiling. No fictional population or flat per-dealer entitlement is used to make the allocation look complete.

Source: [U2] proposed allocation. Deliverables and acceptance criteria [P], 22 September 2026. Costs are planning envelopes, not estimates validated by procurement quotations.

COMMERCIAL & PARTICIPATION REVISION

Capability comparison: commercial work

The same commercial questions remain available in every route; the depth and effort depend on scope and evidence.

Capability	EUR 0 route	EUR 100k route	EUR 300k route
Opportunity analysis	Included with limits: owner-prepared supported cases.	Included for the selected pilot scope.	Included for a wider accepted scope; expansion conditional.
AIM product navigation	Reuse the accepted parts view and classification.	Reuse, with targeted context improvements where needed.	Same core; selected improvements, not a new catalogue.
PRISM fleet context	Manual review on supported historical bases.	Included for the pilot; no invented dealer allocation.	Same rules across more accepted participants.
IDS linkage	Manual, validated relationships only.	Included where identity and source detail support it.	Wider validated coverage; no distributor audit score.
Genuine/BVP comparison	Manual source checks and application approval.	Selected comparisons in the case workflow.	More supported range coverage, not automatic fitment.
Competitor evidence	Case-specific dated references.	Selected evidence preparation and comparability checks.	Broader selected evidence only if useful and permitted.
Financial scenarios	Manual eligible-part calculations; missing costs remain missing.	Repeatable selected scenarios and review.	Same discipline across a larger accepted scope.
Action tracking	Controlled internal register.	Persistent shared-case behaviour where authorised.	More delegated handling and support continuity.
Distributor outputs	Controlled review documents at actual source level.	Repeatable pilot outputs; restricted access only when accepted.	Wider supported participation and local adaptation.
Dealer outputs	Distributor-led own-business review and responses.	Prepared tasks and controlled dealer access where justified.	More enablement and onboarding, subject to capacity.

Included does not mean already implemented. The table describes the proposed scope of each route. Every source-dependent capability remains limited by the actual period, identity, application evidence and permitted audience. Budget cannot turn unavailable dealer data into an observation.

Sources: [U2]; [W] pp. 15-35, 48-54. All route definitions are proposed [P]. Existing capabilities are reused only after their actual usable scope is confirmed.

COMMERCIAL & PARTICIPATION REVISION

Capability comparison: participation and operation

The additional cash should reduce specific operating weaknesses, not buy more screens by default.

Capability	EUR 0 route	EUR 100k route	EUR 300k route
Participation incentives	No additional external payment. Existing distributor rebate unchanged.	EUR 15k controlled dealer experiment.	EUR 100k eligible dealer-enablement envelope.
Recognition	Proposed acknowledgement within existing authorised channels.	Measured pilot examples; limited administration.	More evaluation and peer-learning support, not a league table.
Automated refresh	Manual controlled imports; no new hosted schedule assumed.	Only selected repeatable jobs where approved.	More accepted connections where recurring value warrants them.
Permissions and access	Internal use plus separately restricted outputs.	External access only after implemented controls pass review.	More role and participant coverage; same evidence standard.
Data-quality controls	Owner-run source and correction checks.	Targeted mapping/quality support.	More capacity for exception handling and local variation.
Pilot evaluation	Internal baseline and case outcome record.	Defined evaluation work and incentive-exit test.	Broader evaluation, only on comparable groups.
Maintenance	Owner-dependent; narrow scope and explicit absence plan.	Documented recurring work and selective specialist help.	More operational support, but no permanent team assumed.
Support and handover	Named internal deputy or planned pause.	Tested documentation and recovery for selected work.	More delegated operation and resilience where contracted.
Specialist dependency	Blocked work stays internal or deferred when expertise is unavailable.	Accepted, bounded work packages; ownership retained internally.	More specialist capacity for demonstrated gaps only.
Recurring cost	Existing tools/time still have cost. No new external spend.	First-year approved costs inside the envelope; later costs need approval.	Same boundary, with a larger selected operating scope.

The most important difference is not analytical accuracy: that standard is unchanged. It is how many participants can be supported reliably without making the owner the permanent manual coordinator of every correction, response and refresh.

Source: [U2]; proposed scope [P]. The figures are first-12-month allocations, excluding recoverable VAT, not recurring annual entitlements or approved spending.

COMMERCIAL & PARTICIPATION REVISION

Complexity comes from the operating model

A simple-looking page can require difficult source, identity and response work behind it.

Dimension	Owner-built route	Focused route	Larger route
Product	Few complete tasks; preparation and response may occur through controlled documents.	Selected connected reviews and cases.	More task and role coverage only after successful reuse.
Data	Small source set; manual exceptions.	Selected mapping support and repeatable corrections.	More participants and local source variation to maintain.
Analytical	Same strict definitions; manual review of sensitive comparisons.	Repeatable reviewed calculations, not automatic causality.	More coverage, not a lower proof threshold.
Technical	Internal operation; no unsupported external portal.	Targeted access, persistence and recovery where needed.	More selected integrations and monitoring.
Organisational	High owner dependency; narrow named response scope.	Shared responsibilities and documented handover.	More coordination and capacity, not less governance.
Adoption	Useful outputs and reputation; little practical setup subsidy.	Controlled enablement experiment and onboarding.	Larger enablement effort with a stronger exit test.
Maintenance	Manual burden constrains scale.	Some burden reduced; internal ownership remains.	Broader reach creates more exceptions despite better support.

Do not buy avoidable complexity

Do not require a dealer to become a data-integration specialist to confirm a local explanation. Do not add a recurring feed when a case-specific statement answers the question. Do not promise a real-time service when a prepared monthly review is the useful task. The complexity should be justified by a participant decision, not by visual sophistication.

> **THE COMMERCIAL POINT**
>
> The EUR 300,000 route is not simply easier than the EUR 100,000 route. It can fund more assistance, but broader participation also creates more support, mapping and maintenance work. Its net operating benefit must be demonstrated.

Sources: [U2]; [W] pp. 32-35, 41-44, 48-54. All comparisons are proposed operating consequences [P], not measured delivery estimates.

COMMERCIAL & PARTICIPATION REVISION

Take the owner-built route seriously

The owner can establish commercial value without commissioning a new platform, provided the supported scope is explicit.

The strongest owner-built contribution is the commercial logic: which observation merits review, which alternatives should be checked, how the benefit is measured and what the participant receives. The owner can prepare initial interfaces, analytical routines, data templates, review outputs and pilot iterations using authorised resources. This does not imply unlimited time or that every technical requirement is safely owner-built. [U2]

A credible zero-additional-cash form

Begin with an internal decision product, controlled source imports, a short action record and separate distributor-specific outputs. Dealer feedback can return through the distributor and the responsible case owner. An existing accepted parts view can support the review without making a new external login a condition of participation. Work needing unavailable specialist capacity remains deferred or narrower; it is not solved by bypassing controls.

Measure the workload before expanding

CAPACITY MODEL

Monthly owner hours = source acceptance and preparation + correction and mapping + review preparation + coordination and follow-up + product maintenance and recovery + evaluation. Record initial development separately. Hours are measured by task; they are not inferred from the number of pages or dealers.

For a transparent planning illustration, saving one hour on each of ten comparable reviews releases ten hours. If new corrections and follow-up consume six additional hours, net capacity released is four hours, not ten. This is arithmetic, not a measured ISZE baseline, and it is not automatically a cash saving. [C]

Before accepting recurring participant work, name a deputy for source refresh and case continuity, retain a recoverable accepted version and document how to restart the process. When cover is unavailable, plan a narrow service window or a temporary pause instead of implying continuous availability. Holidays and staff changes are ordinary operating conditions, not exceptional excuses.

THE COMMERCIAL POINT

The zero-cash route can prove the proposition. Its scale is limited by the time and expertise genuinely available, not by the ambition of the interface.

Sources: [U2]; [W] pp. 37, 41, 48-54, 76-77. Owner capability expectations, capacity model and worked time example are proposed planning assumptions [P/C], not measured staffing requirements.

COMMERCIAL & PARTICIPATION REVISION

Use specialists for defined gaps

The owner retains the product and commercial logic; purchased engineering should leave accepted behaviour and a usable handover.

Candidate work package	Focused engineering allowance	Deliverable and acceptance
Restricted access and export behaviour	Up to EUR 8,000	Implement the approved access pattern where external use is selected. Changing account or export route cannot disclose another participant's records.
Repeatable refresh and recovery	Up to EUR 7,000	Implement only the selected source process. Repeated input does not duplicate activity; a correction is traceable; restoration from the agreed backup is demonstrated.
Shared context and case persistence	Up to EUR 5,000	Keep the accepted distributor, account, period and original part through the review and response. A saved decision remains available after restart.
Testing, documentation and handover	Up to EUR 5,000	A second authorised person can follow the instructions, reproduce the selected result and recover a failed run.

These proposed sub-envelopes total the EUR 25,000 engineering line in the focused option. They are neither supplier quotes nor four compulsory contracts. First inspect the existing capability: if it already meets the requirement, reuse it and leave the allowance unspent. The separate EUR 10,000 assurance line evaluates the accepted implementation independently; it is not another implementation budget. [U2; P]

The EUR 50,000 engineering line in the larger option provides an additional EUR 25,000 total allowance for demonstrated gaps such as selected connectors, recovery or delegated case handling. It does not justify an unbounded rebuild. Broader source support and onboarding have their own lines; do not hide them inside engineering as well.

The purchase decision

Each proposed purchase identifies the problem, dependency, deliverable, acceptance test, costed scope, authority and handover. A budget does not establish permission to deploy or access company systems. A supplier should not become the only party able to run a core commercial calculation.

> **THE COMMERCIAL POINT**
>
> Spend external software money where it removes a real reliability, access or workload constraint. Do not outsource the business reasoning that makes Universe useful.

Source: [U2]. Sub-allocation and work packages are proposed [P], 22 September 2026; total EUR 25,000 within the first-12-month EUR 100,000 route, ex recoverable VAT.

COMMERCIAL & PARTICIPATION REVISION

Two pilots, two learning questions

ITUK should test a dealer-account review; Portugal should test a useful national return and dealer participation without invented purchasing detail.

Pilot element	ITUK: UK trucks	I Motors: Portugal
Hypothesis	A prepared own-account review plus a relevant response earns useful dealer context.	A national review and a dealer-chosen task can provide value before dealer-attributed purchasing exists.
Available starting evidence	Named-account monthly purchasing for calendar 2025; distributor billing and separate assessment context.	National part-by-month purchasing; distributor billing and separate dealer self-assessment context.
First participant return	One historical account question with supported original parts, plus an application, supply or commercial response.	One national range question plus an agreed dealer improvement or parts-support task.
What is missing	A current comparable named-dealer cycle; validated site/assessment links where needed; new outcome records.	Dealer purchasing attribution; validated assessment relationships and new outcome records.
Permitted analytical depth	Within-year account purchasing; no invented dealer fleet or end-customer demand.	National purchasing; no allocation of national totals to individual dealers.
Operating test	Record preparation, corrections, specialist effort and usefulness for the selected task.	Measure whether the narrower return is worth using and which extra detail genuinely improves it.
Next decision	Repeat on a compatible source and test another eligible task.	Continue the national service; request dealer detail only for a defined further return.

The first controlled preparation remains internal and distributor-led. Dealer participation should follow promptly once the distributor validates the question and the audience, owner and response are ready; it should not be postponed until every future integration exists. This is a proposed practical sequence, not approval to contact a dealer or send data.

The selected participant count, availability and capacity are not established. Choose a bounded cohort through the distributors and record it before measuring adoption. A narrow successful case proves that case; it does not establish network-wide readiness.

> **THE COMMERCIAL POINT**
>
> The two pilots should teach different things. Portugal is not a failed ITUK pilot, and ITUK's greater source detail does not justify imposing its structure everywhere.

Sources: [W] pp. 54-57; [R] pp. 18-24, 49-51; [D]; [U2]. Pilot design and next decisions are proposals [P].

COMMERCIAL & PARTICIPATION REVISION

Release funding against evidence

The common core starts now; later cash follows useful interaction and repeatable operation, not completion of a feature list.

Checkpoint	Required evidence and responsible role	Proposed cash release
Internal preparation	Business owner and source owners confirm scope, accepted sources, classification and the first question. Prepare restricted reviews and baseline tasks.	No new external cash required to begin authorised analysis.
Source and operating viability	Source and technical owners accept the relevant definitions and correction behaviour. A case owner and responding function accept the first live task. Obtain accepted scopes for purchased work.	Up to EUR 20,000 initially; cumulative EUR 20,000.
First useful dealer return	Distributor and pilot evaluator observe a real task, a substantive response and participant-confirmed usefulness. Access and output separation pass.	Up to EUR 30,000 more; cumulative EUR 50,000.
Repeatable exchange	A compatible later cycle, corrections and handover work; effort is sustainable. The dealer chooses another eligible task and actions have follow-up.	Up to EUR 35,000 more; cumulative EUR 85,000.
Approved exception	Business owner approves a defined additional need and its acceptance, without weakening earlier controls.	Up to EUR 15,000 reserve; maximum total EUR 100,000.
Larger participation decision	Evidence supports additional dealer enablement and operating capacity. A revised costed scope explains the incremental return.	Consider a EUR 300,000 total ceiling; at most EUR 200,000 above the focused envelope.

The initial EUR 20,000 proposal is drawn from engineering EUR 8,000, data quality EUR 5,000, independent assurance EUR 5,000 and evaluation EUR 2,000. These are staged uses of the existing allocation lines, not extra money. Later release does not force spending on a line that is no longer necessary.

A failed identity or access test stops the affected external output. An unanswered case stops expansion of that service. An unsuccessful adoption test prompts a narrower or revised return. These are decision points, not fixed delivery dates or declarations that implementation has already passed.

THE COMMERCIAL POINT

The full ceiling is not released because the paper is finished. It is released only as accepted work and participant evidence justify the next commitment.

Sources: [U2] envelopes and evidence-gate requirement; [W] pp. 53-54, 76-77. Tranches and initial sub-allocation are proposals [P], ex recoverable VAT, first 12 months.

COMMERCIAL & PARTICIPATION REVISION

Measure the exchange, including why people stop

Useful participation, reliable responses and financial outcomes need separate measures and denominators.

Measure	Definition	Interpretation limit
Useful first task	Participants completing the agreed task correctly and receiving a usable response, divided by participants attempting an eligible task.	A pleasant demonstration or a login is not completion.
Repeat use	Participants using the service again for eligible work within the stated observation period.	No eligible work is not inactivity; reporting compliance is measured separately.
Contribution effort	Submission, correction, review and follow-up time on comparable tasks.	A faster task with necessary checks omitted is not an improvement.
Response quality	Time to substantive answer, unresolved age, rework and participant-confirmed resolution by service class.	Acknowledgement and administrative closure are not resolution.
Action economics	Actual adoption/support expenditure per accepted action and per action with an evidenced benefit.	An unmeasured benefit is unknown, not zero and not a forecast.
Incremental contribution	Case-level result on a pre-defined comparison, excluding overlapping credit and displacement.	A later billing increase does not by itself establish causality.

Test the product after additional support ends

The proposed incentive-exit observation covers the next two eligible cycles. Keep normal service and the established reporting incentive unchanged. Record continuation, non-use and reasons: effort, no relevant task, poor response, staff changes, source friction or insufficient return. Support terms and the observation design should be clear in advance.

Use comparable tasks through the existing process and Universe. A staged introduction or matched comparison can strengthen the evidence where practical, but the paper does not claim that a small convenience sample proves causality. Set numerical adoption or response targets after baseline measurement and capacity review, then keep the definitions fixed for evaluation.

> THE COMMERCIAL POINT
>
> Stop or redesign a service when it repeatedly returns less value than the effort it demands, when no responsible function can answer, or when it encourages unsupported commercial conclusions. Expand only when usefulness, repeatability and a credible cost case are all present.

Sources: [W] pp. 43-44, 67-68; [U2]. Measures, exit observation and stopping rules are proposed [P], not achieved performance or approved service targets.

COMMERCIAL & PARTICIPATION REVISION

Useful lessons from other service models

Borrow the mechanism that earns cooperation, not a competitor's technology stack or financial claim.

John Deere: control over who receives the information

John Deere's Data Services description says users can set permissions controlling other parties' access, including which dealers can see account data, and can export files. It also cautions that a recipient may retain or use a shared copy. This is a provider description of controls, not evidence of adoption or financial impact. [E1]

Lesson for Universe. Explain the permitted audience before asking for optional information. Let the participant use a selected contribution and retain its permitted history. Do not promise that revoking future access can recall a previously downloaded copy.

Volvo Trucks: turn information into a service action

Volvo Trucks describes using vehicle operation and component information to plan service, contact the customer and prepare workshop resources. The relevant mechanism is that the information changes an operational response, not simply a chart. The description does not establish an equivalent Isuzu service or a quantified benefit for Universe. [E2]

Lesson for Universe. A parts or service question should lead to a scoped technical, supply or commercial answer with an owner. Continuous telematics is not required to test that principle with the current purchasing and case information.

TecCom: connect the reference to the next task

TecCom's quick guide describes activated partner relationships using the correct supplier/customer identity, item entry, supplier availability responses and transfer from catalogue selection into the working basket. It also describes configuration and credential dependencies. [E3]

Lesson for Universe. Carry the selected part and account into the next request instead of asking the counter to retype them. Preserve the actual relationship and implementation limits. Universe need not replace distributor ordering to remove repeated preparation.

> **THE COMMERCIAL POINT**
>
> These examples support design principles: control, returned service and continuity of work. They do not validate the proposed budget, dealer adoption rate or financial return.

Primary provider sources [E1-E3] rechecked online on 22 September 2026. These replace the longer inherited example catalogue for this revision; no provider performance or return on investment claim is adopted.

COMMERCIAL & PARTICIPATION REVISION

What management should approve next

Approve a bounded commercial proof with a funded route to repeatability, not a general platform build.

The recommended decision is to retain the owner-led product direction and authorise a controlled ITUK and I Motors pilot, with the existing reporting mechanism unchanged. Approve a conditional EUR 100,000 first-12-month external cash ceiling and the staged release described in this paper. The initial release is up to EUR 20,000 against accepted scopes; the remainder is not a commitment to spend. [P]

Approve	Do not imply
A prepared distributor review and an early, controlled dealer task with an accountable response.	A live integrated application, every service ready, or permission to contact every dealer.
The price-free recurring core on the actual existing arrangement, with a defined correction route.	A new contractual demand for prices, margins, stock, customers or workshop records.
Selected specialist, quality and assurance work that removes demonstrated constraints.	An outsourced rebuild, unlimited owner capacity or bypass of information-technology controls.
A measured dealer enablement experiment and an explicit end to additional support.	A permanent payment for reporting, a dealer entitlement or a new rebate percentage.
Evaluation of contribution, effort and repeat use on stated bases.	Guaranteed sales recovery, a causal return from a later invoice or a network-wide opportunity total.

The single most important next step

Arrange the first prepared distributor-and-dealer task with one real question, a permitted audience, a named case owner and a responding function that has accepted the work. Measure the current effort before the interaction. That task tests the commercial promise and begins creating the explanation and outcome record the existing files cannot supply.

No-budget analysis can proceed inside the authorised working area. External operation, commitments and purchases require the corresponding accepted scope. If no cash is approved, use the owner-built route openly rather than silently assuming free specialist work. If the pilot shows useful repeat participation and a specific capacity constraint, reconsider the larger EUR 300,000 total envelope on that evidence.

> **THE COMMERCIAL POINT**
>
> Universe becomes a practical commercial product when participants can point to a decision it improved and an answer it returned. Until the pilot demonstrates that, the adoption and financial case remain testable propositions, not realised results.

Sources: [U1-U2]; [W] pp. 39-44, 53-59, 76-77. Management recommendation and release amounts are proposals [P], dated 22 September 2026, ex recoverable VAT.

APPENDIX / ASSUMPTIONS

Assumptions that the pilot must resolve

The uncertain points are specific enough to test; none needs to be hidden behind a general readiness score.

Assumption or dependency	Current status	Test and consequence
The existing KPI incentive is a sufficient starting mechanism.	Owner confirms the 2025 initiative and 20% rebate linkage. Exact contractual field scope is not supplied.	Use the existing terms. Do not expand them through product wording; confirm only the genuinely missing operating detail.
Dealers value a prepared review or parts response.	Proposed, not demonstrated by a repeated live Universe interaction.	Observe actual tasks and repeat eligible use. Redesign the return if it is not useful.
The owner can sustain the chosen scope.	Intent is clear; available hours and workload baseline are not supplied.	Measure preparation, handling and maintenance; limit scope or buy a specific accepted service.
Source identity and classification are usable.	Data exists; the roadmap records unresolved release and relationship authority.	Accept the relevant release and relationships before dependent claims. Preserve unresolved records.
Additional dealer support removes a real barrier.	Funding envelopes are proposed; eligible population and costs are unknown.	Approve a defined activity, evaluate later use and stop payments that purchase only compliance.
Optional information improves the answer.	Plausible by service, not a universal requirement.	Request only the decision-changing item; retain the narrower service if it is declined.
Incremental contribution can be attributed.	No complete programme outcome series is supplied.	Define the comparison before action; report observed change and attribution uncertainty separately.
A broader external product is ready to operate.	Not established by the supplied documents or by this review.	Verify actual access, recovery, ownership and capacity before external multi-user expansion.

The absence of a historic case register is not a reason to postpone the first case. The absence of current stock, fitment authority or a comparable dealer period does prevent the corresponding claim. Distinguish a record the service creates from a source or permission it actually needs.

Sources: [W]; [R]; [U1-U2]. Status as assessed for this document, 22 September 2026. Reported system observations are not a new inspection of the operating environment.

APPENDIX / CALCULATIONS

Calculation and valuation notes

The published examples can be reproduced without exposing raw billing or a full price list.

Calculation	Basis and result
ITUK pad billing change	EUR 302,366.25 minus EUR 347,389.58 = -EUR 45,023.33; divided by the 2024 base = -12.9605%, displayed as -13.0%.
ITUK recorded quantity change	3,402 / 4,562 minus 1 = -25.4274%, displayed as -25.4%. These are recorded pad-category quantities, not services or repaired trucks.
Selected braking-range concentration	Pad, rotor and shoe reductions sum to EUR 47,068.77. EUR 45,023.33 / EUR 47,068.77 = 95.6544%, displayed as 95.7%. Not the whole Brakes family.
Portugal clutch-kit billing	EUR 31,702.47 minus EUR 29,959.87 = EUR 1,742.60; / 2024 total = 5.8164%, displayed as 5.8%. Use source precision for component totals.
Static concession illustration	5% x EUR 302,366.25 = EUR 15,118.31, assuming unchanged quantity, mix and unit cost. No demand response or avoided saving is inferred.
Gross-profit-preserving quantity	Baseline quantity x baseline unit gross profit / proposed unit gross profit. If proposed unit gross profit is zero or negative, no ordinary positive-volume break-even is claimed.
Cash-only action requirement	Ceiling / assumed incremental contribution per non-overlapping beneficial action, rounded up when a whole-action count is needed. Add costs outside the envelope for a fully costed hurdle.
Participant unit cost	Actual eligible expenditure / defined onboarded, retained, action or beneficial-action population. Keep the period and definition; do not use logins as the denominator.

Gross profit is revenue less the aligned cost of goods sold. Gross margin is gross profit divided by revenue. A lower purchase price, a support credit, released capacity and incremental profit are separate measures. Every estimate names its beneficiary, comparison, time period and uncertainty.

No transaction-level billing, full price list, confidential cost series or invented part pairing is included in this paper. The figures are selected aggregate source observations or explicitly labelled arithmetic illustrations.

Sources: [M], [F], [N]; calculations independently checked 22 September 2026. Financial definitions and hypothetical scenarios follow [W] pp. 36-39 and [U2].

APPENDIX / ACCEPTANCE

Acceptance before participant-facing use

A polished page is not evidence that its source, permissions or response promise are sound.

Test	Required behaviour
Context and source	The selected distributor, account, original part, period, sales stage and basis remain visible through the review and response.
Reconciliation	Monthly and annual controls are separate; source joins conserve activity; unresolved parts and accounts remain visible.
Correction	An identical input adds no activity. A replacement supersedes the declared version and identifies affected outputs.
Optional participation	Declining a nonessential contribution leaves unrelated core work available and explains the narrower answer.
Application and model	No pairing becomes approved fitment without authority; no national fleet is allocated to a dealer; observed and modelled results remain distinct.
Assessment	Question, answer, version and available period are retained. Missing is not poor performance, and no distributor audit score is created.
Response and outcome	A named owner and next update exist; acknowledgement, substantive response, delivery and commercial outcome are separate.
Access and export	A user, generated answer and exported file contain only the permitted information. Hidden menus do not count as access control.
Recovery and cover	The accepted result can be reproduced or restored, and an authorised second person can follow the operating instructions.
Artificial intelligence, where used	Retrieved text cannot change permissions or approvals. Generated explanations remain source-grounded and human-reviewed for consequential decisions.

Artificial intelligence (AI) can help find relevant evidence, summarise a case or prepare a draft. It does not approve application, financial terms or information access. Essential tasks need a usable non-AI route. The product should retain readable text, keyboard access, clear status wording and a list alternative to maps; these are implementation requirements, not a conformance claim.

> **THE COMMERCIAL POINT**
>
> A failed test prevents the affected external claim or action from being presented as complete. It does not automatically disable every unrelated internal analysis.

Sources: [W] pp. 48-54, 69-71, 75-77; [U2]. Tests are retained and condensed as proposed acceptance requirements [P]; no claim is made that an application has passed them.

APPENDIX / SOURCE RECORD

Source and revision record

This is a dated revision for review, not an assertion that a new operational version has been approved.

Reference	Source and use
[W]	Isuzu Universe White Paper, version 1.1, revised edition, 21 September 2026, 80 pages. Primary document reviewed. All W page references in this revision point to that supplied revised edition, not its earlier visual edition.
[A]	ISZE AIM management presentation, approved 20-slide edition, supplied 21 September 2026; cover dated 20 September 2026. Used for product terminology, the exact cover palette and supported category examples. Slide notes preserve their source limitations.
[R]	Isuzu Universe Delivery Roadmap and Pilot Operating Plan, version 1.0, 21 September 2026, 135 pages. Used as reported evidence of dependencies and proposed operation. Its environment inspections were not independently repeated here.
[N / O]	ISZE numerical context [N] and operations/open-work context [O], both as of 19 September 2026; read with the business and writing rules. Numerical reference billing horizon: 30 June 2026. Restricted working totals and unusable fleet forecasts are not reproduced.
[M]	Supplied original/Genuine and BVP category-mix summary, as of 19 September 2026, selected ITUK and Portugal full-calendar 2024/2025 records. Arithmetic recomputed for this revision on 22 September 2026; original source definitions and exclusions retained.
[D]	Supplied combined sales-to-dealer records, selected calendar-2025 monthly named-dealer records for ITUK and national records for Portugal. Coverage checked on 22 September 2026; national and annual controls were not added to the dealer-month rows.
[F]	Supplied spend-per-truck summary, calendar 2025, as of 19 September 2026. Used only for the stated market fleet context in the examples: ITUK 22,389 on the DVLA March 2026 register basis; Portugal 8,176 on the supplied historical basis. Neither is allocated to dealers.
[U1]	Business-owner clarification in this conversation, 22 September 2026: historical difficulty and inefficiency in distributor data requests, limited visible return, 2025 major-KPI initiative, 20% of the normal kickback linked to reporting, independent-distributor context and the need for dealer participation.
[U2]	Supplied white-paper review brief, current conversation, 22 September 2026. Source of the three alternative funding envelopes, initial allocations, owner-build direction, design requirements and review tests.
[P / C]	New proposals [P] and calculated illustrations [C] in this revision, 22 September 2026. They are not measured results, supplier quotations, expenditure approvals or contractual changes.

The supplied version 1.1 remains the source document. This output is titled *Commercial and participation revision, 22 September 2026*; no invented version number or automatic supersession is asserted. The companion review records the treatment of the original pages and the new requirements.

No raw billing or full price-list material is attached or reproduced. Monetary examples remain subject to their stated source scope and permitted audience.

APPENDIX / RESEARCH & DESIGN

Research and design notes

External sources support selected design mechanisms, not the investment return.

Reference	Primary source rechecked 22 September 2026	Use and limit
[E1]	John Deere, *Data Services*. deere.com / Data Services	Account permissions, dealer visibility and export; provider description, not an ISZE outcome.
[E2]	Volvo Trucks, *Uptime services*. volvotrucks.com / Uptime services	Vehicle use and monitoring connected to service planning and prepared workshop resources; no claim that Universe has this capability.
[E3]	TecAlliance, TecCom Wiki, *Quick Started / Quick Guide*. TecCom Wiki / Quick Guide	Partner identity, item handling, supplier response and catalogue-to-task continuity, with setup dependencies; no procurement recommendation.

Evidence labels used in the paper

Source-supported observation means a figure or statement found in a supplied source on its stated basis. **Calculated** means arithmetic performed on those observations or on explicit hypothetical inputs. **Owner-confirmed** identifies business direction or history supplied in this conversation. **Proposed** identifies a design, spending or operating recommendation. **Unvalidated** identifies a benefit or adoption assumption still to be tested.

Visual treatment

The page background and accent colours were read from the actual AIM cover: dark charcoal #24282C, Isuzu red #D71920, white and light grey. This is the precise dark treatment requested, rather than a substitute navy. The AIM deck specifies Arial; the PDF uses the available metrically compatible Arimo font because Arial is not installed in this production environment. No font files accompany the document.

Charts show source-category comparisons or labelled planning calculations. No monthly history has been fabricated from annual totals; no flow diagram implies measured customer migration; no budget chart represents actual expenditure. The proposed decision page is visibly labelled and does not claim implemented functionality.

> THE COMMERCIAL POINT
>
> The paper is ready for management review of the proposition. Live service acceptance, participant invitations, commercial support and expenditure remain separate decisions.

Sources: [A] actual cover colour and font declarations; [E1-E3] primary sources; [U2]. Design and source checks performed 22 September 2026.
