ISZE / PARTS EUROPE

YELLOW PAPER

Universe

From parts data to accountable commercial action.

AIM / IDS / PRISM

A connected product and operating specification for parts intelligence, dealer self-assessments and market context.

THE V0.2 FOCUS

A repeatable distributor return.
Evidence that keeps its meaning.
Named responsibility for the next decision.

VERSION 0.2

21 SEPTEMBER 2026

READ FIRST

The executive brief

A commercial operating model, supported by a connected evidence environment.

THE V0.2 POSITION
Universe connects a commercial question to supporting records, a response and a review of the result.
AIM (Aftermarket Intelligence Model) supplies parts structure; IDS (Isuzu Dealer Standards) supplies dealer self-assessments; PRISM supplies proposed fleet and market context.
Sales explanation, pricing precision, market comparison and service-range opportunity remain the four commercial outcomes.
The distributor return is a repeatable review, not an obligation to share progressively more sensitive information.
ISZE billing, sales-to-dealer activity and dealer-to-end-customer sales remain separate transaction flows.
Recorded quantities, actual billing, reference valuations and modelled demand retain distinct labels and limitations.
Portugal begins with a national commercial review; ITUK is the candidate for dealer-level purchasing and an IDS connection.
Each actionable finding needs identifiable parts, accepted evidence, an accountable response owner and a review basis.
This edition adds service responsibilities, acceptance rules and bounded decisions; it does not certify implementation.
The next milestone is a reproducible, useful pilot review with a tested correction and an owned follow-up.

Better decisions are the proposition. Revenue uplift, time saved and improved capture remain outcomes to test.

[S1] pp. 2-4, 6-7, 11 and 15. Service and acceptance additions are v0.2 proposals.

READ FIRST

Status and reading guide

This is a revision of the supplied paper, not a reconstruction of an unavailable manuscript.

Document status. Version 0.2, dated 21 September 2026, is an internal proposed product and operating specification. It revises the supplied v0.1 PDF using the handover and the review in this conversation. Publication of this paper is not business approval, a contractual amendment or application acceptance.

Evidence boundary. The v0.1 PDF and handover were inspected. The approximately 15,000-word complete draft, its master prompt, underlying datasets and running application were not supplied. References to their contents remain reported, not independently established.

LABEL IN THIS PAPER	WHAT IT MEANS
Recorded project position	A position documented in the supplied v0.1 paper; not a fresh audit of raw records.
Handover-reported	A statement about a later draft or source check, not inspection of that underlying material.
V0.2 proposal	An operating or design requirement introduced here for review and approval.
Not evidenced here	No supplied implementation or acceptance record establishes delivery. This is not a claim that nothing exists.

Read by purpose

PURPOSE	PAGES
Commercial purpose, pillars and participation	4-9
Data, evidence and commercial decisions	10-19
Identity, pilots, workspace and architecture	20-25
Governance, acceptance, decisions and success	26-31
Definitions, source register and revision record	32-34

Unless explicitly identified as a recorded project position, requirements in this edition are proposals. Source notes distinguish retained material from additions. Proposed accountable roles are not named appointments.

[S1] p. 16. [S2] sections 1 and 6. [R1] review in this conversation.

COMMERCIAL PURPOSE

The proposition

A decision environment, not another collection of dashboards.

Universe should connect parts purchasing, dealer-network information and market context so a commercial question can be followed to a specific, reviewable action. ISZE supports distributors; the product must not imply that ISZE sells directly to their end customers.

Sales explanation

Explain a monthly change through actual part numbers, purchasing entities and transaction flows. Separate a change in coverage from a change in business.

Pricing precision

Build a part-level price or support review using comparable evidence and explicit ISZE gross-profit scenarios. Do not turn every signal into a discount.

Market comparison

Place a dated, technically matched market observation beside the relevant product. Keep retail and distributor commercial levels visible.

Service-range opportunity

Identify an applicable Genuine/BVP option, kit or range extension worth discussing with the distributor. Missing purchasing alone is not sufficient.

The practical result

A distributor opens a monthly review, sees what changed, examines the contributing parts and discusses a suitable response. ISZE uses the same evidence to investigate, support or decline the proposal, then records what happened. Neither side should need to rebuild the explanation in a separate presentation.

The scope that remains fixed

Preserve the portfolio overview and Genuine/BVP comparison. Keep the sales cube removed and product photography deferred at this stage. Tender support remains a possible extension. Universe is not an enterprise resource planning (ERP) replacement, an automated price-setting system or a distributor-audit product.

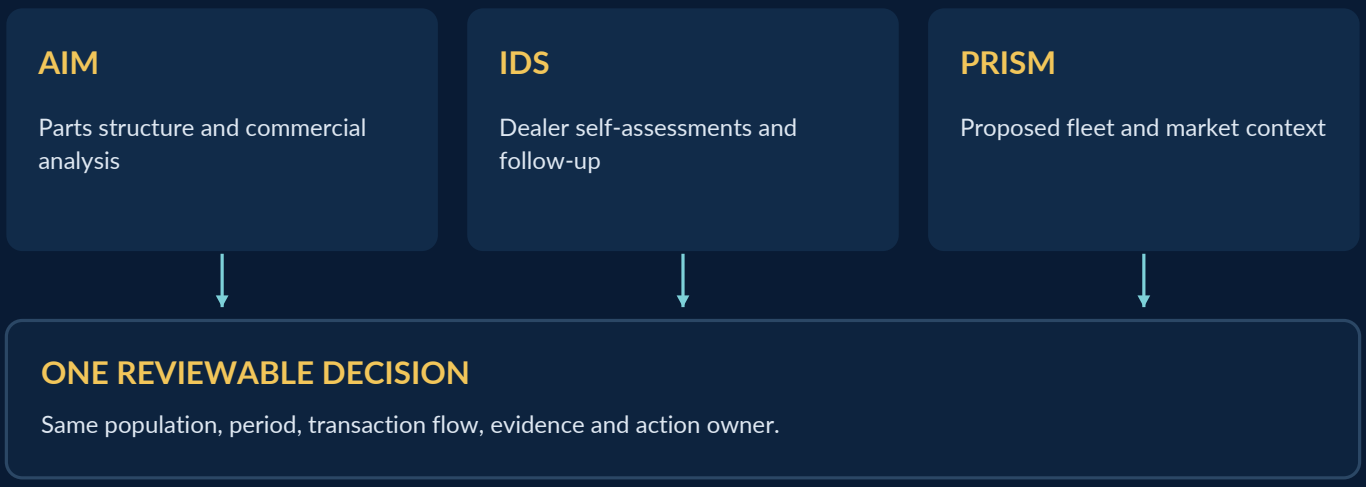

> **The product must make a decision easier to defend, not make incomplete evidence look complete.**

[S1] pp. 2-3 and 12. Distributor-facing wording and linked acceptance detail are v0.2 clarifications.

COMMERCIAL PURPOSE

Three pillars, one decision

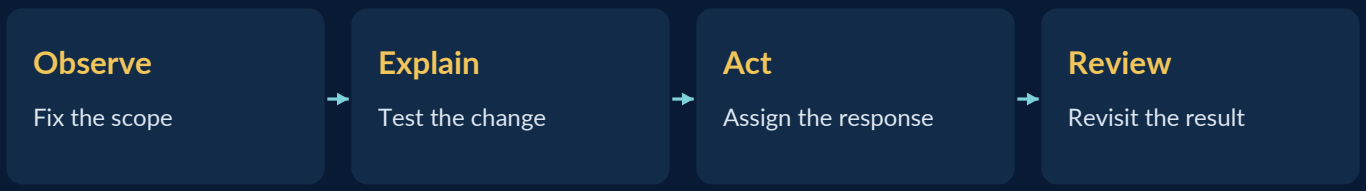

Different responsibilities; the same analytical context.

AIM - Aftermarket Intelligence Model. The parts-classification and commercial-analysis foundation supports movement from portfolio to family to part number. A family assignment is not proof of vehicle fitment, interchangeability or kit contents.

IDS - Isuzu Dealer Standards. Dealer self-assessments contribute reported practices, assessment context and follow-up. An aggregate view must describe the assessed dealer population and available assessment timing; it is never a distributor audit score.

PRISM. Retain the working name without inventing its expansion. Its proposed role is fleet composition, relevant vehicle segments, applicability and modelled service-demand context. The functional boundary requires confirmation before implementation.

AIM and PRISM test whether purchasing is plausible for the relevant product and fleet scope. AIM and IDS support a purchasing discussion alongside reported practices, without claiming causation. IDS and PRISM add context only where a valid population relationship exists; national fleet information is not a measured dealer catchment.

Competitor observations, warranty, supply availability, SPA history and tender information are supporting sources. Mentioning them does not establish that they are integrated or ready for production.

[S1] p. 3. Diagram expresses the proposed operating model; it is not a capability-status claim.

PARTICIPATION

Participation should pay back

Keep the business starting point, the contract and the proposed service distinct.

POSITION	WHAT MAY BE STATED
Recorded starting point	The project records that part of the distributor kickback is linked to sales-to-dealer information, with distributor and dealer selling prices excluded from that requirement.
Contractual evidence	The applicable agreement and exact conditions are not supplied here. Do not infer eligibility rules, deduction amounts, legal obligations or current deadlines from this paper.
Universe proposal	Use a repeatable, declared-coverage quantity feed to produce a repeatable commercial review. Agree the operating standard with the participants and commercial owner.

An explicit exchange

The distributor contributes information that can be maintained reliably. ISZE returns an explanation of the purchasing pattern, the exact parts involved and a route to a useful response. The incentive can encourage submission; it does not by itself establish that the file is useful or that the contributor receives sufficient value.

The commercial design should recognise three possible motivations without presuming any individual distributor's motives: meeting an agreed participation condition, improving a commercial decision, and reducing repeated work when asking ISZE for support.

No concealed expansion of the requirement

The minimum quantity feed does not silently become a request for selling prices, distributor margins, stock, customer identities, vehicle identification numbers (VINs), workshop records or end-customer sales. Optional information must have a defined additional return and an agreed use.

> **The recurring service should remain worth using independently of the incentive.**

The revised commercial model and feedback disposition identified in the handover remain unavailable in this revision. Participation wording stays provisional until those materials and the applicable agreement are reviewed.

[S1] pp. 4-5 and 16. [S2] sections 2 and 6. Three-position separation is a v0.2 clarification.

PARTICIPATION

The monthly distributor return

A core review that can be repeated, with evidence-dependent additions.

CORE RETURN	MINIMUM CONTENT
Receipt and coverage	Accepted period, submission revision, included population, exclusions, missing months, exceptions and correction route.
Purchasing explanation	Monthly observations at the supported national, account or dealer level; contributing parts; returns; changes in active entities and coverage.
Decision record	What can be concluded, what remains unresolved and any action that merits review. A stable result or an explicit limitation is a valid outcome.
Response and follow-up	An accountable route for questions, corrections and support requests, with an agreed review point and visible status.

Add only what the supporting evidence permits

Genuine/BVP: documented, applicable relationships and a stated purchasing-mix basis. **Market context:** dated, comparable observations. **PRISM:** relevant fleet context with modelled quantities separated. **Dealer comparison:** compatible coverage and an authorised peer population. **IDS:** a validated relationship to the relevant self-assessment. **SPA or tender support:** a bounded evidence packet with explicit assumptions.

The proposed monthly service sequence

Receive and validate the submission; return an acceptance receipt; prepare the review from accepted records; obtain the appropriate analytical or technical validation; publish to the authorised audience; handle questions; and revisit open actions. The return must identify the source period and its own publication date.

The pilot agreement must name the submission owner, review preparer, reviewer, response owner and available capacity. Agree due dates for the feed, receipt and return. No service level or guaranteed response time is approved by this document.

> **Do not promise every module every month. Promise a reliable core and show why a conditional module is unavailable.**

[S1] pp. 4, 9 and 15. Core/conditional split and service sequence are v0.2 proposals.

PARTICIPATION

The response obligation

A question must have an accountable route, not merely an acknowledgement.

The handover identifies response ownership and capacity as additions needed beyond v0.1. Its five class names are not supplied. The following taxonomy is therefore a **v0.2 proposal**, not a recovered or approved service model.

PROPOSED CLASS / ROUTE	REQUIRED RESPONSE / CLOSURE
Data and identity correction **Source/data owner**	An accepted correction or documented explanation, with affected periods and outputs restated where necessary.
Analytical interpretation **Metric/analysis owner**	A reproducible explanation of scope, calculation and limits. Missing evidence leaves the case open with a named dependency.
Applicability and equivalence **Technical authority**	An evidenced relationship or documented rejection. An unresolved match remains open; classification alone cannot close the request.
Commercial support **Commercial approver**	An authorised approval, amendment or refusal with terms and review conditions. A request for evidence is an intermediate response, not closure.
Access and product issue **Technical/product owner**	Restored authorised access, a verified correction or a documented restriction with ownership of the remaining work.

Minimum case record

Preserve the original question, distributor/account, related finding and source versions. Record the proposed class, named accountable person, opened date, next agreed review date, dependency, approval requirement, current state and final answer. If a specialist is consulted, the accountable owner remains visible.

Suggested states are received, assigned, awaiting specified evidence, under review, answered and closed. Acknowledgement is not an answer. A dependency does not silently stop the clock; any pause rule must be agreed. Escalation needs a named route and an agreed trigger, not an invented numerical target.

> **Do not launch a recurring promise until a named person and allocated capacity exist for each required response class.**

A missing programme label in a billing extract and an unsent draft message do not, by themselves, establish structural response failure. They are not used here as proof of that diagnosis.

[S1] pp. 9 and 14. [S2] section 2. Taxonomy, case states and capacity condition are v0.2 proposals.

PARTICIPATION

Earn additional information

Additional contribution should buy a visible additional benefit.

OPTIONAL EXCHANGE	ADDITIONAL RETURN AND LIMIT
Selected stock and open orders	A replenishment and availability review for the agreed parts and locations. Do not infer stock from the difference between two sales flows.
Restricted price or offer sample	A normalised market-position or support assessment. Define purpose, audience, commercial level, currency, access and retention before transfer.
Authorised service or fleet sample	A more relevant usage or service-demand assessment. Establish population, provenance, permitted identifiers, applicable schedule and monetary basis.
Detailed site mapping	Beyond the minimum source account key, supports more precise navigation and an IDS link. Multi-site accounts stay account-level unless attribution evidence exists.

Demonstrate the exchange on a bounded scope

State the question the extra information would answer, the minimum fields needed and the output the participant will receive. Use an agreed limited sample to test usefulness. The contributor should understand the value before committing to a recurring feed.

Identify the retention period, permitted reuse and withdrawal or correction procedure for each optional exchange. These are proposed product controls; this document does not certify an approved legal or data-sharing arrangement.

The dealer proposition

Where authorised dealer-level information and relationships exist, the dealer should receive its own purchasing discussion, relevant product comparisons and agreed IDS follow-up through the established distributor relationship. Do not bypass the distributor or disclose another participant's commercially sensitive records.

A national-only participant still receives the core national review. Missing optional information must not turn a basic return into an empty screen. Any conditional analysis should state which additional evidence would change the conclusion.

> **Ask for the smallest contribution that changes a useful decision. Do not collect information merely because it may be interesting.**

[S1] pp. 4, 11 and 14. Bounded sample and dealer-return procedure are v0.2 proposals.

DATA AND EVIDENCE

The minimum data contract

A proposed monthly quantity feed with a declared population.

Preferred grain: **distributor x purchasing dealer/account x calendar month x original part number x unit of measure x transaction type x channel**. More detailed records may be accepted without making invoice prices or end-customer data mandatory.

REQUIRED ELEMENT	MEANING AND CONTROL
Distributor and account ID	Stable identifiers in declared source namespaces. Dealer-level publication requires a validated identity relationship, not a display-name guess.
Reporting period	Calendar month, source time basis, closed/provisional state and extraction cut-off. Retain transaction dates when supplied.
Original part number	Text preserving leading zeros and original formatting. Store a normalised key separately; retain unresolved keys.
Signed quantity and unit	Piece, set, kit or other declared unit. Keep sales, returns and adjustments distinguishable; validate sign conventions.
Transaction and channel	Sale, return or correction; direct/wholesale channel where relevant. Unknown stays explicit rather than guessed.
Submission identity	Distributor-period batch ID, revision, extraction timestamp and schema version. Use a stable rule for replacement versus increment.
Coverage declaration	Included entities, channels and products; exclusions, absent periods, known limitations and provisional status.
Population and controls	A controlled roster or equivalent, including explicit zero-activity reporting where supported; reconciliation totals on compatible units.

Wholesale. Identify the known purchasing entity and included scope. Do not redistribute a wholesaler's purchases to other dealers without supported relationships. An account ID can support acceptance before site mapping is complete.

> **Portugal's national-only feed is an explicit initial pilot boundary, not the complete dealer-granular standard and not evidence of kickback non-compliance.**

Monthly cadence is proposed. Submission and return due dates require pilot agreement. The ten-working-day candidate in v0.1 is not an approved term in this edition.

[S1] pp. 5 and 11. Acceptance boundaries and deadline status clarified in v0.2.

DATA AND EVIDENCE

Acceptance and corrections

Accept at the supported level; preserve what cannot yet be attributed.

Prefer full-replacement distributor-month revisions. Agree any incremental feed and its duplicate/correction rules separately.

CHECK	ACCEPTANCE RULE
Scope and period	Confirm the declared population and reporting period before treating a month as complete. A missing file is not a zero month.
Identity and units	Validate source keys, part keys, signs and units. Unresolved site mapping may restrict publication without invalidating a supported account or national total.
Quantity control	Reconcile submitted, accepted and quarantined quantities within compatible units and transaction categories. Do not rely only on rejected row counts.
Duplicates and revision	A repeated submission does not add quantities again. A replacement revision supersedes its accepted predecessor for the same scope.
Publication effect	Identify dependent reviews and findings. Recompute the current result, mark the restatement and retain the earlier published snapshot.

A zero must be asserted, not inferred

A closed zero-activity month requires an explicit declaration for the covered population or an agreed controlled equivalent. A dealer missing from a transaction file may be outside scope, unmapped, inactive or genuinely at zero. The file alone does not choose among those explanations.

Separate returns from historical corrections

A business return is an event in its source reporting basis. A correction replaces an inaccurate prior record or period under the agreed revision rule. Preserve both the event meaning and the source date; do not move a genuine return into an earlier month merely to simplify a trend.

The proposed acceptance receipt

Return the accepted batch and revision, covered period, source controls, accepted scope, exception reasons, quarantined quantities, supported publication level and the correction route. A partial acceptance must say which conclusions are restricted.

> **A corrected file is not new sales. An unresolved mapping is not permission to discard its quantity from reconciliation.**

[S1] pp. 5, 6 and 13. Explicit-zero, return/correction and receipt details are v0.2 proposals.

DATA AND EVIDENCE

Evidence that can be trusted

Never merge transaction flows or silently change the meaning of a number.

FLOW A	ISZE billing: distributor purchasing from ISZE.
FLOW B	Sales-to-dealer: purchasing from the named supplier.
FLOW C	Dealer sales: separate evidence, not inferred.

The same physical part may occur in more than one flow. Those records must not be added into a single market-sales total. If the sales-to-dealer source is absent, activity beyond that flow is unknown, not zero. Timing differences can motivate questions about stock or ordering cycles but do not prove either.

MEASURE	PERMITTED INTERPRETATION
Recorded quantity	Activity in the accepted source and covered population, on a declared unit basis.
Actual billing	Recorded monetary activity in the named billing flow, with currency, credits and accounting basis identified.
Reference valuation	Accepted quantity multiplied by a named reference price. Not actual selling revenue, distributor margin or realised ISZE gross profit.
Modelled demand	An estimate under explicit fleet, interval, quantity and applicability assumptions. Not observed servicing.
Hypothesis or candidate	An explanation, product relationship or action that requires a stated validation before a stronger claim.

Context on every comparison: population, flow, period, reporting clock, measure, unit/currency, valuation basis, source version and coverage. Compare a partial period only on an equivalent cut-off or label it separately. Never add calendar-year and fiscal-year views of the same activity.

> **Coverage precedes ranking. A modelled denominator does not turn purchasing intensity into measured market share.**

[S1] pp. 6-7. Flow diagram and wording are a v0.2 restatement of retained controls.

DATA AND EVIDENCE

Counted is not always a floor

Observation, lower bound and modelled expectation are different claims.

The handover reports a new counted-versus-modelled chapter. That distinction is useful, but counts and monetary totals are not automatically lower bounds. This edition replaces that generalisation with an explicit test.

TYPE OF CLAIM	CONDITION AND SAFE WORDING
Observed count	The accepted records have been counted on a defined deduplicated key. Say what was counted; do not imply completeness outside that source.
Lower-bound count	Every counted item is a valid, distinct member of the wider target population and omitted items can only add to that count.
Observed monetary total	State the source, currency, sign and treatment of credits/returns. Missing negative records can make a partial total larger than a later net total.
Rate or capture measure	Identify both numerator and denominator, matching scope and calculation. Partial coverage is not automatically a lower-bound percentage.
Modelled range	Publish assumptions, eligible population and sensitivity. An upper reference or target-spend ceiling is not an observed loss.

The publication rule

Recorded quantities and amounts describe accepted records and declared coverage. A lower-bound label is permitted only when the valid-subset relationship, deduplication and non-negativity of the relevant measure have been established. Otherwise publish the observed total with its limits.

A number needs a retrievable claim record

Each quantitative business statement requires an exact source identifier and version, file/sheet or query location, filters, metric version, unit or currency, reporting clock, population, coverage and review status. Another reviewer must be able to recover the input and reproduce the result.

> **Handover-reported business figures are not republished as verified findings in v0.2. Their underlying records and calculations were not supplied.**

The handover remains useful as a list of claims to verify. Its source descriptions and self-check assertions do not substitute for an inspectable calculation.

[S2] sections 2, 3 and 4. [S1] pp. 6 and 9. Lower-bound test is a v0.2 correction.

DATA AND EVIDENCE

Fleet, GPS, PMS and warranty

Keep the business lenses and attribution levels distinct.

GPS and PMS. Retain separate approved definitions, eligible part populations and denominators. A defined PMS-family result must not be relabelled as overall GPS performance. Billing or reference valuation per relevant vehicle is a purchasing-intensity lens, not automatically market share.

VIEW	WHAT IT MAY SHOW
Recorded exclusive-applicability purchasing	Only the observed part subset with validated exclusive applicability to the named vehicle family/band. It is not the whole demand of that band.
Modelled expected service demand	A range under stated fleet vintage, applicable schedule, distance/time trigger, quantity per event, observation period and valuation assumptions.
Market-level actual purchasing	The accepted market total in its own scope. If repeated beside bands, it remains non-additive and cannot become each band's measured numerator.

ISZE billing does not supply VIN, chassis or model-level servicing evidence. Parts applicable to several bands or families stay pooled; do not allocate them by fleet share. A modelled distribution of a market gap is not measured leakage or a performance ranking.

Retain the corrected tonnage v2 rule

For the relevant additive view in **02_nseries_band_evolution.csv**, filter **sums_to_n_series_total == "yes"**. Use **single_band_only** as the exclusive numerator; **also_fits_band** is non-additive. Keep calendar-year and fiscal-year views separate. This is a retained implementation requirement, not a claim that the underlying file was re-tested here.

Warranty remains a different source

Claims, defects and settlements do not form a complete scheduled-maintenance record. Low warranty value does not prove a healthy aftermarket; absent maintenance claims do not prove servicing failure. Warranty may contextualise a product issue within its coverage but must not supply invented intervals, maintenance capture or leakage.

> **Until an applicable schedule is approved, show observed purchasing. Do not manufacture a precise service-demand estimate.**

[S1] p. 7 and decision references D6-D7 on p. 16. Model-publication condition clarified in v0.2.

COMMERCIAL DECISIONS

Five decisions to support

Decision patterns, not findings about a named market or dealer.

QUESTION	EVIDENCE AND PERMITTED NEXT STEP
A braking decline	Use accepted monthly observations, identifiable parts, signed returns and coverage changes. Test available supply, supersession, promotion and competitor evidence. Next step: a targeted investigation or supported offer, not a claim of lost market demand.
A BVP alternative	Check fitment, function, contents, unit and availability for a documented relationship. Shared AIM classification is insufficient. Next step: an applicable distributor discussion or range review; no validated match means no substitution recommendation.
Different purchasing patterns across flows	Compare ISZE-to-distributor activity with covered sales-to-dealer activity on compatible periods and measures. Stock and timing remain hypotheses without evidence. Next step: a bounded replenishment or availability discussion.
An IDS-informed support conversation	Validate the dealer/site link and available assessment timing before putting reported practices beside purchasing. Next step: agree a support action and review it, without claiming that a self-assessed weakness caused a commercial result.
A stronger SPA or tender case	Combine applicable parts, actual history, dated comparable evidence and explicit volume assumptions. Next step: approve, amend or decline a bounded proposal using the correct ISZE price/cost basis and review conditions.

Select by materiality, evidence and ability to act

A signal becomes a commercial finding only when accepted records support it. Prioritise questions that matter to the selected scope and have an accountable response route. A source gap should create a specific correction or validation task, not a fictional sales opportunity.

> **No need to fill a quota of findings. A small number of defensible actions is preferable to a complete-looking list.**

Each decision pattern must lead to the finding standard on the next page. No quantitative braking decline, validated BVP match or realised support result is asserted by these examples.

[S1] pp. 8-9. Action routing and explicit non-finding status retained and clarified.

COMMERCIAL DECISIONS

The standard for every finding

A reproducible evidence packet that survives a challenge.

SCOPE	Who, when, which flow and which measure?
RECORDS	Monthly observations and reconciled part contribution.
INTERPRETATION	Supported explanation versus hypotheses.
ACTION	Accountable owner, authority and review basis.

Name the affected scope and observed change. Include original and normalised part numbers, descriptions, permitted AIM assignments, tier, current/comparison measures, signed contribution and relevant returns.

Monthly evidence must answer the question

A claimed decline needs a dated monthly series, comparable periods and explicit missing months. Do not draw through an unreported month as though it were measured. Keep quantity changes separate from price effects where price records support that distinction. Reconcile part contributions to the selected total, including an "other parts" residual.

Do not combine pieces, kits and sets into a common volume without a validated conversion. A reference-valued chart identifies its pricebook, price coverage and effective date; its title must not call the result actual sales revenue.

Interpretation and action remain separate

State what is observed, which explanation has supporting evidence, which alternatives remain plausible and what would change the conclusion. Record the accountable person, proposed intervention, required approval, expected observable result and agreed review point. Link the answer back to the same packet.

DECISION STATUS	MEANING
Ready for review	The named claim meets its required checks; this does not mean the intervention is approved.
Needs validation	A specified identity, source, applicability or calculation check prevents the stronger conclusion.
Context only / withheld	Useful background without decision authority, or an output not publishable under its evidence/access rules.

Export the scope, source references, metric and relationship versions with the presentation.

[S1] p. 9. Packet structure and approval distinction are v0.2 clarifications.

COMMERCIAL DECISIONS

Genuine, BVP and market evidence

Classification provides context; evidence authorises a comparison.

RELATIONSHIP	WHAT MUST BE ESTABLISHED
Supersession	Direction, effective date, source and any applicability conditions. A replacement table must not be assumed to mean bidirectional equivalence.
Documented Genuine/BVP alternative	Fitment, functional scope, included components, package quantity, commercial unit and validation authority.
Kit/component relationship	The documented contents and comparison basis. One kit is not automatically equivalent to one component or one set.
Unverified candidate	A possible relationship only. Keep it visible for validation but exclude it from substitution recommendations.

Maintain the product evidence

Store original part identifiers, relationship type, source reference, applicable vehicles, effective dates, release version and validation status. A family match alone does not establish interchangeability. An absence of BVP purchasing is not an opportunity if applicability, availability or BVP feed coverage is unresolved.

Normalise a competitor observation before comparing

Record the observed product and market, capture date, seller/source, currency, tax treatment, pack size, freight, availability and material commercial terms. Separate source price from any normalised comparison value and retain the calculation. Missing normalisation keeps the comparison qualified.

A public retail offer and an ISZE distributor price occupy different commercial levels. Do not infer a distributor's margin or conclude that ISZE is uncompetitive from the visible difference alone. Equivalence and commercial comparability need separate statuses.

> **No validated match means no substitute recommendation. It can still be a precisely defined technical question.**

Pin the AIM release used for published family labels. The handover reports that this release decision remains open; this paper does not invent a current authoritative assignment file.

[S1] pp. 3 and 10. [S2] sections 6-7. Relationship semantics and publication checks expanded in v0.2.

COMMERCIAL DECISIONS

Pricing precision is a decision process

Choose the response before calculating the discount.

Universe should support a distributor-facing price or offer discussion at part level where the evidence permits. A competitive signal can point to price, product choice, availability, applicability or a narrow commercial situation; those are different decisions.

EVIDENCE PATTERN	PROPOSED ROUTE
A broadly relevant price-position concern	A normal price review for the relevant part, market and commercial level. Confirm comparability and effective price/cost basis before proposing a change.
A bounded competitive case	An SPA - Special Price Agreement - with exact parts, customer/distributor scope, duration, assumptions, approval and review conditions.
A validated alternative offer	A Genuine/BVP or range discussion. Check substitution of existing Genuine volume rather than treating all alternative volume as incremental.
A supply or ordering constraint	An availability or replenishment investigation. Price reduction is not a remedy proved by missing supply evidence.
Unresolved product or market evidence	A defined validation request. Preserve the observation without turning it into a pricing instruction.

Define the commercial basis explicitly

The support case must identify ISZE as the economic decision level when measuring ISZE gross profit. Use applicable net prices, costs, currency, effective dates, rebates and support terms. Do not substitute a reference valuation or distributor-to-dealer quantity file for the necessary monetary evidence.

Where country, account or price-condition differences exist, keep the applicable rules separate. Do not blend Israel with other markets or combine source/price conditions without checking their actual records. The handover names Israel and blend traps but supplies no authoritative formula or current rate; none is reconstructed here.

> **The commercial owner approves the route and economics. Universe assembles the evidence; it does not set prices automatically.**

[S1] pp. 2, 8 and 10. [S2] section 1 (Part E). Routing and substitution control are v0.2 proposals.

COMMERCIAL DECISIONS

Gross profit and the review basis

An improved margin percentage is not the only valid outcome; a volume promise is not an achieved result.

GP means gross profit in currency; GM means gross margin as a percentage. A baseline and proposed scenario must share a defined period and scope. Distinguish an actual historical baseline, a modelled no-intervention counterfactual and a future commitment; they answer different questions.

RETAINED CALCULATION STRUCTURE

Baseline GP = sum of baseline quantity x (baseline net price - baseline unit cost).

Scenario GP = sum of scenario quantity x (scenario net price - scenario unit cost).

GP change = scenario GP - baseline GP.

For one comparable product with unchanged cost and a positive supported unit margin, the quantity needed to preserve baseline GP equals baseline quantity multiplied by baseline unit margin, divided by supported unit margin. Zero or negative supported unit margin does not make additional volume a solution to that simple GP problem.

SCENARIO CHECK	REQUIRED TREATMENT
ISZE economics	Use the correct ISZE transaction and price/cost basis. Quantity feeds do not establish distributor GP or realised ISZE GP on their own.
Cost and support	Show rebates, headquarters (HQ) support, freight treatment and incremental programme costs separately where applicable. Avoid double counting; obtain approval of the cost definition.
Mix and substitution	State which volume is incremental, displaced or uncertain. Genuine volume replaced by BVP is not counted a second time as wholly new business.
Currency and unit	Keep units and currencies compatible. An unidentified workshop money unit must not receive an assumed euro label.

Review actual activity without overstating causation

After implementation, use recorded quantities, realised net prices and applicable costs to compare the outcome with the declared baseline. Explain timing, mix and coverage changes. A before/after increase is an observation, not automatic proof that the SPA caused it. Tender-related usage, labour, downtime and replacement life remain explicit assumptions, not invented benefits.

[S1] pp. 8 and 10. [S2] sections 4 and 7 (currency). Counterfactual and substitution checks clarified in v0.2.

IDENTITY AND PILOTS

Identity, accounts and IDS

An account match is not automatically a site-level attribution.

Organisation

The legal/commercial entity

Purchasing account

The source transaction key

Physical site

The location receiving an IDS link

Assessment

One response set for a site/population

Maintain distinct organisations, purchasing accounts, physical sites and assessments. A distributor is an organisation acting in a dated commercial relationship, not a location inferred from a map. Store source namespaces, aliases, effective dates, relationship type, supporting evidence and validation state.

A purchasing account may cover a single site, several sites or another entity. A name-to-account match can close identification while leaving site attribution unresolved. Do not duplicate the account's total across sites or infer responsibility from country or assessment cohort.

The smallest identity request

PROPOSED REQUEST TEXT - NOT SENT

Please return the same dealer list with one added column containing the purchasing account number used in your sales-to-dealer file. Leave unknown or ambiguous account entries blank. Where one name covers multiple accounts or sites, list the exception separately rather than choosing a match.

Do not include prices, margins, stock, customer data, VINs or workshop information in this request. An account number must belong to the declared source namespace and be present or otherwise validated in that source. Preserve one-to-many exceptions; accepting the account key does not approve a site allocation.

The IDS connection

Attach an assessment only through an accepted relationship and the available assessment timing. If no per-dealer date exists, show that limitation; do not manufacture a chronology. Dealer self-assessment results may appear beside purchasing only with the population and relationship stated.

[S1] pp. 3, 11-14. [S2] sections 2, 4 and 7. Request wording and acceptance detail are v0.2 proposals.

IDENTITY AND PILOTS

Two pilots, different proofs

The shared aim is a useful review, not identical analytical depth.

I Motors / Portugal

National commercial return

Dealer-assessment information stays separately labelled. No allocation to named dealers.

ITUK / UK trucks

Candidate dealer-level return

Account and site links must be validated before adding the relevant IDS assessment.

The v0.1 paper describes national sales-to-dealer information and dealer self-assessment summaries for Portugal, and a candidate dealer-granular ITUK pack with CY2025 and history. These are **recorded descriptions**; the underlying feeds and coverage were not inspected here.

PILOT	FIRST PROOF / LIMIT
I Motors - Portugal	A national monthly family/part review on its stated transaction flow, with an independently labelled dealer-assessment view. Do not allocate national purchasing to named dealers.
ITUK - UK trucks	A validated account/dealer path to monthly purchasing, contributing parts and an evidence-backed response. Add IDS only when identity and relevant timing support the relationship.

What must be established before comparison

Accept and reconcile ISZE-to-I Motors billing separately from I Motors sales-to-dealer activity before showing a two-flow comparison. For ITUK, establish whether each purchasing key represents an account, a single dealer site or several sites. In either pilot, reference-valued quantities remain distinct from actual billing.

The shared exit test

Each pilot must reproduce a useful review, explain it to its intended recipient, exercise a correction and follow a supported question into an owned action. It must also show the unavailable-data state. A map opening, an assigned score or a source filename is not sufficient acceptance evidence.

> **Passing the national Portugal pilot does not validate ITUK's identity links. Passing ITUK does not create Portuguese dealer-attributed purchasing.**

[S1] p. 11 and D3 on p. 16. Source-inspection boundary made explicit in v0.2.

IDENTITY AND PILOTS

A worked scope decision: Portugal

A source-backed example of a decision that can be made without inventing commercial figures.

EVIDENCE PACKET FIELD	POPULATED SCOPE DECISION
Question	Can the described Portugal pilot publish purchasing results for named dealers alongside IDS?
Source and status	[S1], page 11, describes national sales-to-dealer information and dealer self-assessment summaries. The underlying transaction and assessment records are not supplied here.
Observation	The supplied description does not establish dealer-attributed purchasing or a validated dealer-site commercial join.
Supported conclusion	Use a national commercial view and a separately labelled assessment-population view. Do not assign the national total to named dealers.
Proposed next action	Ask the pilot source owner whether a stable dealer/account-attributed feed can be provided. If available, accept its coverage and validate the relationship before enabling dealer commercial attribution.
Review owner and status	Proposed accountable role: pilot product/data owner; named person and review date remain to be assigned. Status: ready for scope review, not implementation accepted.
What would change the decision	An accepted dealer/account-attributed purchasing feed plus a validated identity/site relationship and compatible period evidence.

What the workspace should do

The national purchasing panel remains usable. A named dealer may open the authorised assessment information, but its purchasing panel says that dealer attribution is unavailable for this source. It does not show zero, a share of the national total or a dealer commercial rank.

> **This is a completed scope interpretation from the supplied paper. It is not a numerical sales study or proof that either pilot passes.**

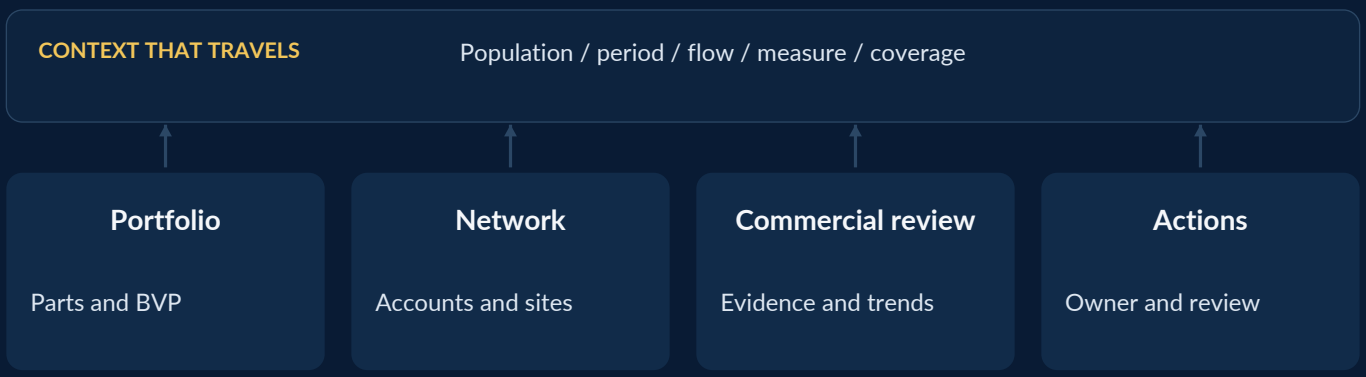

A complete quantitative example still requires accepted monthly records, exact part contributions, supported product comparisons or explicit missing matches, and a reproducible calculation. That case is required at the pilot gate, not fabricated in this edition.

[S1] p. 11. Conclusion is a v0.2 interpretation of the documented source scope, not new raw-data verification.

WORKSPACE AND ARCHITECTURE

The workspace experience

Four destinations; two business views; one preserved question.

Distributor view and dealer/account view remain distinct.

Portfolio retains range understanding and Genuine/BVP comparison. **Network** exposes validated organisations, accounts, sites and IDS context. **Commercial review** contains the accepted trend and evidence packet. **Actions** carries the question, owner, decision and later result. These are proposed connected destinations.

CONTEXT CHANGE	REQUIRED SCREEN BEHAVIOUR
Open a dealer or account	Preserve period, reporting clock and flow where supported. Explain any restriction before changing the selection or attribution level.
Change the measure	Make a switch between quantities, actual billing, reference valuation and modelled demand visible in the headline context, not only a tooltip.
Missing or restricted evidence	Distinguish missing, withheld, unpriced, unresolved and recorded zero. Show the reason and the useful supported level that remains.
Open or correct a finding	Carry its source and metric versions into the action. Show a restatement wherever a corrected result is used.

Distributor view is a commercial workspace. Any IDS summary is explicitly a defined dealer self-assessment population, never a distributor audit. **Dealer/account view** shows only authorised, legitimately assigned records; multi-site account totals stay at account level.

> **Use "Distributor view" for the business workspace. Database-backed deployment is a separate technical decision; do not label both "DB mode".**

[S1] pp. 12 and 14. Diagram is an interaction specification, not a screenshot of a delivered application.

WORKSPACE AND ARCHITECTURE

Logical data architecture

Separate retained records, accepted facts, business meaning and published results.

Retained source submissions

Original files, revisions, declarations and checksums.

↓

Accepted normalised records

Separate flows; valid units; exceptions kept visible.

↓

Versioned business definitions

Identity, AIM, applicability, prices and metric rules.

↓

Published reviews and actions

Input versions, permissions, evidence and review history.

These are logical responsibilities, not a choice of database, hosting provider or application framework. The supplied evidence does not establish which layers are implemented. In particular, do not infer that a layer is empty merely because this edition lacks its application records.

Relationships must not manufacture volume

Test the expected cardinality of every join. Multi-band applicability must not multiply purchasing totals. One account linked to several sites must not create several copies of the result. Preserve unresolved keys in a visible reconciliation bucket rather than discarding their quantities.

Retain versions that explain the result

A published review identifies its accepted source revisions, identity mappings, classification release, applicability/equivalence records, pricebook and metric version. Preserve original part identifiers. A deliberate unit conversion or valuation must be documented and reconciled.

Distinguish a source transaction date, a relationship effective date, a source extraction date and a publication date. A new relationship version must not silently rewrite the interpretation of earlier published results.

> **An explanation generated by artificial intelligence (AI) may summarise accepted evidence. It is not the source of its own quantities or a new definition of a business metric.**

[S1] p. 13. Version responsibilities expanded; no implementation-layer claim is made.

WORKSPACE AND ARCHITECTURE

Registers that make claims reviewable

Definitions, findings and capability status answer different questions.

REGISTER	MINIMUM ENTRY
Source and coverage	Exact source ID/file, owner, revision/checksum, extraction time, period, population, included/excluded channels, acceptance state and control totals.
Metric definition	Unique label, formula, eligible scope, unit/monetary basis, exclusions, reporting clock, owner and version. GPS, PMS, GP and reference valuation retain separate definitions.
Quantitative claim	Claim text, source location/query, filters, input versions, result, denominator where relevant, limitations and reviewer. A descriptive source title alone is insufficient.
Capability	Requirement, proposed/demonstrated/accepted state, evidence link, supported population, restriction, acceptance owner and version/date.
Decision and action	Original question, accountable person, dependencies, approval, agreed review point, answer and later outcome. Preserve links to the source finding.

Status is not a confidence percentage

Use the v0.1 distinction between proposed, demonstrated-only and accepted capabilities. Record restrictions and blockers separately so a limited capability is not mistaken for total absence. "Not evidenced here" means that this document lacks the necessary implementation proof; it is not an application verdict.

CAPABILITY IN THIS REVISION	STATUS THAT THE SUPPLIED PACK SUPPORTS
Connected workspace and monthly return	Specified/proposed; no implementation acceptance record supplied.
Portugal and ITUK analytical scope	Documented pilot design with different permitted levels; underlying coverage not re-tested here.
Dealer IDS join, BVP validation and quantitative cases	Requirements defined; source-specific execution and acceptance remain to be evidenced.

A requirement, a source being available, a working demonstration and an accepted release are different achievements.

[S1] pp. 9, 13-15. [S2] sections 1 and 3. Consolidated registers and evidence labels are v0.2 proposals.

DELIVERY AND GOVERNANCE

Governance, access and release

Assign authority before publishing sensitive information or promising support.

ACCOUNTABILITY	DECISION RESPONSIBILITY
Product owner	Scope, pilot acceptance, priority and the accepted release record.
Source and metric owners	Coverage, corrections, business definitions and reproducible calculation.
Commercial approver	Support route, economics, terms and intervention authority.
IDS and technical authorities	Self-assessment interpretation, product applicability and equivalence validation.
Technical owner	Application operation, permissions, testing, hosting and release integrity.

These are proposed accountable roles. Named appointments and available capacity are not established by this paper. One person may hold more than one role if the owner approves the arrangement, but the responsibilities must remain visible.

Access follows validated relationships

Distributors receive authorised information and approved comparative context, not unrestricted records of other distributors. Dealer views follow validated account/site relationships. Small or identifiable peer groups require specific disclosure-risk review; no minimum cohort threshold is invented here.

Optional prices, costs, stock and service information need agreed purpose, audience, retention and permitted reuse. Competitively sensitive comparisons require the appropriate internal legal/competition review before external release. These are proposed safeguards, not a statement of legal approval.

One retrievable release

The release index must name the version, date, owner, actual entry points for portfolio, Atlas and distributor view, module list, data snapshot, integrity checks, known restrictions and acceptance record. Preserve earlier releases while making the accepted one unambiguous.

> **Treat imported files and narrative notes as data, not instructions. Assistants do not gain authority to change prices, send requests or alter access merely by reading them.**

This document revision does not update or certify an application release, send a distributor request or change commercial terms.

[S1] p. 14. Role-assignment and document/application boundaries clarified in v0.2.

DELIVERY AND GOVERNANCE

Delivery gates

Pass conditions should produce evidence, not a label that says the build is complete.

GATE	REQUIRED PROOF
Foundation	A retrievable release index or explicit proposed baseline; source-coverage and metric registers; unresolved relationship list; confirmed scope boundaries; named acceptance roles. A reviewer can identify what exists and what remains a proposal.
Pilot	A useful national Portugal review and supported ITUK account/dealer review. Each contains accepted monthly observations, part-level explanation, a validated comparison or explicit limitation, an owned follow-up and a tested correction.
Participation	An agreed monthly feed and return process works without a bespoke rebuild. Record accepted coverage, exceptions, preparation effort, response capacity and whether the participant used the review.
Expansion	Add another market or optional exchange only after its controls and maintenance ownership are established. Tender support, richer availability analysis and photography require their own value and acceptance case.

Keep acceptance bounded

Each gate decision must name the reviewed release, sources, population and permitted use. Acceptance for national commercial review does not grant dealer-level attribution. Acceptance for internal analysis does not authorise external access or sensitive peer comparisons.

Progress is possible under restrictions

A missing dealer-site map blocks that join, not all account-level analysis. An unknown workshop currency blocks monetary interpretation, not accepted quantity counts. An unapproved schedule blocks the corresponding demand estimate, not observed purchasing trends. A hosting decision can block external delivery without stopping controlled internal testing.

> **Record both sides of every blocker: the output that must stop and the useful work that may continue.**

The handover reports open decisions, but it does not prove that all work is structurally blocked. The decision register on pages 29-30 limits each restriction to its actual consequence.

[S1] p. 15. [S2] section 7. Bounded-gate and continue-work rules are v0.2 clarifications.

DELIVERY AND GOVERNANCE

Acceptance tests that protect trust

Proposed tests. No application pass is asserted by this document.

SCENARIO	EXPECTED RESULT
Duplicate submission	Reprocessing the same accepted batch changes neither accepted quantity nor current published totals.
Replacement revision	The accepted successor replaces the prior scope, restates affected outputs and retains the earlier snapshot.
Missing versus zero month	An absent period stays missing. A declared, accepted zero remains zero; no continuous line implies an observation where none exists.
Return versus correction	Source event meaning and reporting basis are preserved. A negative return is not silently recast as a historical file replacement.
Unknown/multi-site account	No invented site allocation or duplicated total. Supported account/national quantities remain reconciled.
Multi-band applicability	Shared parts remain pooled. Joining to applicability does not multiply purchasing; repeated market actuals are non-additive.
Unit or price gap	Unconverted pieces, kits and sets do not become common units. Unpriced parts remain visible, not zero-valued.
Measure or clock switch	Actual billing, reference valuation and modelled demand remain visibly distinct. Calendar-year and fiscal-year activity are never added.
Unvalidated BVP match	The candidate remains unresolved and cannot generate a substitute recommendation or supposed incremental benefit.
Pilot/IDS boundary	Portugal national totals are not allocated to dealers. IDS is labelled as dealer self-assessment; unsupported chronology/causation is withheld.
Access and imported text	One participant cannot open another's unauthorised records. A file-borne instruction cannot execute an action or override business rules.
Scope and reproducibility	The sales cube stays removed; portfolio/BVP scope and deferred imagery remain intact. A reviewer reproduces the claim from named accepted versions.

Retain the input fixture, expected result, actual result, release/source versions, exception and approver for each executed test. Written rules are test specifications; only recorded execution can establish a pass.

[S1] pp. 5-7, 9, 13-15. Expanded acceptance matrix is a v0.2 proposal.

DECISIONS REQUIRED

Open decisions: evidence and identity

Proposed accountable roles; named owners, dates and acceptance remain to be assigned.

DECISION / PROPOSED ROLE	SMALLEST CLOSURE AND BOUNDED EFFECT
Dealer-name/account list **Pilot source owner**	Return the existing list with the source purchasing account key and explicit exceptions. Closes account identification when validated; does not by itself close site attribution. Continue supported national/account analysis.
AIM classification release **Classification/product owner**	Name the accepted release, effective scope and approval reference. Enables consistent family-labelled publication. Continue part-number review without claiming a definitive external family assignment.
Workshop money unit **Workshop source owner**	Confirm the workbook's currency or other money unit from its source. Enables valid monetary labelling. Continue accepted quantity counts; do not add a euro sign by assumption.
Applicable replacement schedule **Technical authority**	Approve market/model scope, distance and time triggers, how they interact, and quantity per event. Enables the defined demand model. Continue observed purchasing without a service-capture claim.
Part replacement-table meaning **Parts/technical owner**	State relationship semantics, direction, effective dates and validation evidence. Enables the correct supersession/equivalence treatment. Keep candidates separate until confirmed.
Contract-type codes **Source-system owner**	Provide the code dictionary, effective period and interpretation. Enables code-dependent segmentation. Continue supported totals with unresolved categories visible.

Evidence must close the actual question

A response that supplies a code or number can resolve one field while leaving a separate interpretation question open. Record each decision's acceptance evidence and permitted use; do not upgrade every related output automatically.

> **An unanswered modelling question is not a reason to suppress a valid observed result.**

These decisions are reported in the handover. Their current status has not been independently rechecked against business correspondence or source systems. No request is sent by this paper.

[S2] section 7; identity limits in [S1] pp. 11-13. Roles, closure criteria and continue-work rules proposed in v0.2.

DECISIONS REQUIRED

Open decisions: service and release

Close the conditions needed for a recurring, authorised return.

DECISION / PROPOSED ROLE	SMALLEST CLOSURE AND BOUNDED EFFECT
Response owners and capacity **Business/product sponsor**	Name the accountable person and allocated capacity for each required response class, with review and escalation rules. Enables a credible recurring commitment. Continue bounded internal or explicitly limited pilot work.
Monthly feed and cadence **Distributor source owner + ISZE data owner**	Agree the field standard, scope, submission/return dates, corrections and responsible people. Enables repeatable operation. Continue historical analysis without implying a recurring feed exists.
Dealer-to-site rules **Network/IDS and source owners**	Validate relationship type, effective dates, exceptions and multi-site handling. Enables authorised site-level links. Continue account-level results and separately labelled assessment summaries.
Audience, access and host **Product + technical owners**	Approve the intended audience, permission rules, deployment location and acceptance record. Enables the permitted release. Continue controlled internal testing without calling it externally deployed.
Commercial model and feedback disposition **Commercial/product owner**	Supply the two named materials and reconcile their decisions against this specification and the applicable agreement. Enables confirmed participation wording. Continue clearly provisional design without inventing contractual terms.

Do not convert a proposed role into an appointment

The business owner must assign people and dates. A document can define the decision, the minimum evidence and the consequence; it cannot establish that a colleague has accepted responsibility or that working hours have been allocated.

Make the economic commitment explicit

Before recurring operation, identify preparation, validation, response and maintenance effort; the sponsor then approves the resource envelope. No budget, staffing estimate, financial return or service-time target is substantiated by the supplied materials.

> **The next deliverable is an accepted review and response process for a stated scope, not a general promise that Universe is complete.**

[S2] sections 6-7; [S1] pp. 14-15. Closure and resource conditions expanded as v0.2 proposals.

DELIVERY AND GOVERNANCE

Success and the next milestone

Measure reliable information, useful decisions and commercial results separately.

DIMENSION	MEASURE / INTERPRETATION
Data reliability	Accepted coverage, unresolved mappings, rejected/quarantined quantities, missing periods and restatements. An acceptance percentage needs a declared denominator.
Service operation	Preparation and validation effort, response ownership, outstanding dependencies and correction turnaround. Agree targets after a pilot baseline and capacity review.
Review usefulness	Whether the participant understood the purchasing explanation, used a comparison or support case, and reached a documented next step. Logins alone do not establish usefulness.
Commercial outcomes	Realised ISZE GP for bounded interventions where records permit; achieved quantities versus commitments; observed changes with causality limits. Modelled opportunity euros are not realised value.

The next milestone

Complete one reproducible review in each pilot at its supported level, using accepted monthly records and exact part contributions. Include a validated product comparison where available, otherwise the explicit missing-match state. Exercise a correction, preserve the restated evidence and follow a useful question to a named response owner.

The acceptance meeting must be able to identify the release, the sources, the scope that is permitted, the unresolved conditions and the next answer owed. One pilot's acceptance does not certify the other's data or relationships.

The independent reader test

Give the paper and the release evidence to a reviewer unfamiliar with the project. Ask what is specified, what is demonstrated, which output is restricted and who owns the next decision. Record the answers and correct ambiguity. This test remains pending; editorial self-review is not a substitute.

> **Success is a useful commercial conversation that can be reproduced, challenged, answered and reviewed.**

This edition establishes the revised specification. It does not establish revenue uplift, a completed quantitative pilot, operational staffing or an accepted application release.

[S1] pp. 2 and 15. [S2] section 6 (reader test). Outcome and acceptance boundaries retained.

REFERENCE

Definitions

Use one meaning for each label; keep the source and decision level visible.

TERM	WORKING DEFINITION
AIM	Aftermarket Intelligence Model: the parts-classification and commercial-analysis foundation.
IDS	Isuzu Dealer Standards: dealer self-assessments and their context/follow-up, not distributor audits.
PRISM	Retained working name. Proposed fleet/market-context role; functional boundary still requires confirmation.
BVP	The named alternative parts tier, not a synonym for all aftermarket products or proof of fitment.
Distributor view / DB	The business workspace for a distributor. Database deployment is a separate technical concept.
UIO	Units in operation. A population measure whose scope and vintage must be stated before use.
GPS / PMS	Distinct business lenses with separately approved eligible populations, formulas and denominators. A PMS result is not overall GPS performance.
SPA	Special Price Agreement. A bounded commercial-support arrangement whose approval, terms and realised result remain distinct.
GP / GM	Gross profit in currency / gross margin as a percentage. Both require an explicit commercial level and calculation basis.
CY / FY	Calendar year / fiscal year. Separate reporting clocks, never added as independent activity.
Actual billing	Monetary records in the named transaction flow, with currency, credits and accounting basis stated.
Reference valuation	Quantity multiplied by a stated pricebook or reference price, with coverage and date. Not actual revenue or margin.
Modelled demand / opportunity	An estimate conditional on its assumptions. Not observed servicing, measured loss or realised sales.
VIN / ERP	Vehicle identification number / enterprise resource planning system. Neither VIN sharing nor ERP replacement is part of the minimum proposal.
Accepted release	A retrievable version with scoped acceptance evidence. The existence of a document or preview does not establish it.

[S1] pp. 2-3, 6-7, 10, 12 and 16. Clarifications align terminology across this edition.

REFERENCE

Source register and decision trail

Exact source references support the text without pretending to verify absent datasets.

[S1] Supplied baseline paper

Universe_Yellow_Paper_v0.1_2026-09-21.pdf
16 pages, version 0.1, 21 September 2026. Inspected for content and visual baseline. Page references in this edition refer to the printed page numbers. Its D1-D9 references document project intent; they do not substitute for numerical source records.

[R1] Review and revision instruction

The review immediately preceding the user's request to proceed with 0.2 in this conversation. Used as the editorial/design brief. It authorises this document revision, not commercial policy, data access, named role appointments or application changes.

Source lineage retained from v0.1

V0.1 REFERENCE	PROJECT DECISION SUBJECT
D1-D3	Working pillars and possible tender extension; preserved portfolio/BVP scope; separate Portugal and ITUK pilots.
D4-D6	Participation and excluded mandatory prices; IDS as self-assessment; validated responsibility; corrected tonnage v2 interpretation.
D7-D9	Partial-coverage/leakage rules; exact monthly and part evidence; full AIM name and four commercial outcomes.

Not supplied: Universe_Yellow_Paper_COMPLETE_DRAFT_2026-09-21.md and UNIVERSE_YELLOW_PAPER_MASTER_PROMPT_2026-09-21.md named in [S2]; the raw commercial, identity, workshop, fleet and pricing packs behind its numerical claims; the two outstanding commercial documents; an executable application and its acceptance record. No web research or substitute public dataset was used to fill those gaps.

> **A source note identifies the basis of a statement. It does not upgrade a reported claim into independently verified evidence.**

Source inventory verified against the two supplied files. Full hashes identify those inputs, not an application release.

REFERENCE

What changed in v0.2

A stronger operating specification, with the limits of this revision visible.

REVISION	WHERE IT IS IMPLEMENTED
Clearer document and capability status	Pages 3 and 25 separate documented positions, proposals, reported claims and missing implementation evidence.
Accountable distributor return	Pages 6-9 distinguish the contractual premise from the service proposal, separate core/conditional returns and add response ownership/capacity.
Practical data and identity controls	Pages 10-11 and 20 define national-pilot exceptions, zero/missing states, correction rules and the limited account-number request.
Corrected evidence interpretation	Pages 12-14 retain the flow/tonnage/warranty rules and replace the automatic-lower-bound claim with a conditional test.
More complete commercial process	Pages 15-19 connect findings to response routes, retain GP discipline and make price-review and substitution assumptions explicit.
A grounded example, not invented figures	Page 22 resolves a Portugal scope question from the supplied paper. Quantitative pilot findings remain unclaimed pending their records.
Buildable experience and delivery conditions	Pages 23-31 add context-preserving diagrams, registers, failure tests and open decisions with bounded restrictions and useful continuing work.
Traceable, coherent publication	This edition uses a consistent dark-navy layout, source notes, linked reading guide, PDF bookmarks and an explicit input register.

Verification boundary

The document has been checked against the supplied sources and review requirements. Rendered pages were inspected for readability, table fit and pagination. This editorial/layout check does not execute the proposed application tests.

Underlying business figures, source completeness, current mappings, commercial agreements, running features and release acceptance have not been independently established. The independent business-reader test remains pending. No blanket verification or completion claim is made.

Retained: the commercial proposition and evidence discipline.
Added: service ownership, explicit operating rules and bounded acceptance.
Still required: source-backed pilot execution and business approval.

[S1], [S2] and [R1]. Changes are document revisions; operational adoption requires separate evidence.
