ISZE / PARTS EUROPE

COMMERCIAL VISION

Universe 3.0

Give distributors and dealers tools worth using.
Earn the information that makes those tools better.

Value fell 13.0%. Volume fell 25.4%.

Recorded ISZE billing and quantity, ITUK brake-pad source category, full calendar 2024 and 2025. Measured; source snapshot 19 September 2026, arithmetic rechecked 23 September 2026.

WHAT THIS EDITION SETTLES

The scope boundary: routine service is not the product.

One portfolio of five tools, not two competing product stories.

What the campaign investment must earn, and the size floor.

What a dealer and a distributor actually receive, and where each will stop.

VERSION 3.0 · 23 SEPTEMBER 2026

INTERNAL · PROPOSED PRODUCT AND PARTICIPATION PAPER

ISUZU / UNIVERSE 3.0

Commercial vision and participation · 23 September 2026 · Proposed product, for review

A commercial programme that gives distributors and dealers tools worth using, and earns the information that makes those tools better.

Supersedes the Commercial Vision 3.0 of 22 September 2026 and the Commercial Tools Edition of 22 September 2026. Both are withdrawn. This edition carries the scope boundary that the Commercial Tools Edition stated and the 3.0 edition omitted, and it adopts the five-tool portfolio in place of the earlier three-application range.

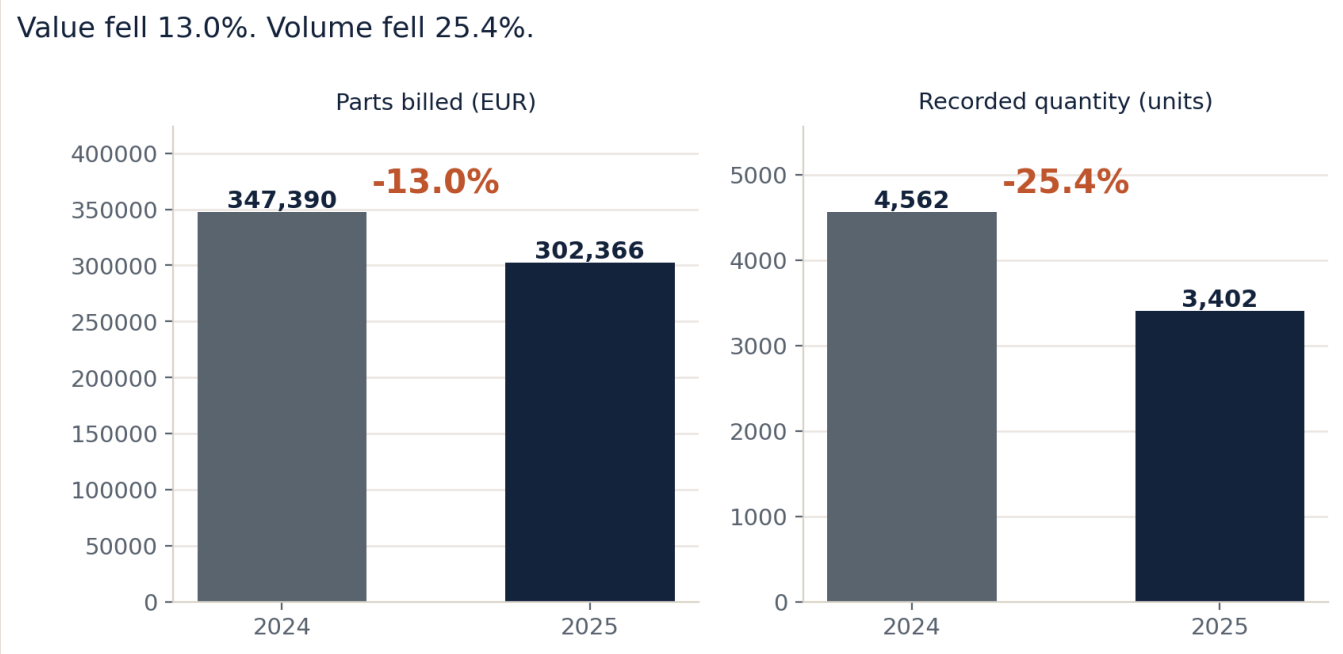

Figure 1. Recorded ISZE billing and quantity, ITUK brake-pad source category, full calendar 2024 and 2025. Measured; source snapshot 19 September 2026, arithmetic rechecked 23 September 2026.

How to read this

Three things can be decided in the next two weeks, and each has its own chapter. Everything else is support for those three.

The three decisions	Where	What is being decided
1. Price concession and campaign support	Chapter 4	Whether a named campaign line, with a minimum campaign size, is funded
2. Dealer and distributor participation	Chapter 8	Whether the first ten invited dealers are approached as designed
3. The opening product	Chapter 9	Which two tool capabilities are built first

Read chapters 1 to 4 and you have the commercial case and the money. Read chapter 8 for what the participants will actually do. Chapters 5 to 7 are the product. Chapters 10 to 14 are method and reference, written so that a reader can check any number in this paper back to its source.

Historical observations keep their original source period. Tool designs, journeys and participation figures are proposals as of 23 September 2026. Numerical scenarios are arithmetic on stated inputs; they are not forecasts of customer response and not records of an achieved result.

What is measured, inferred, proposed and unknown. Every substantive claim carries one of four labels. *Measured* is counted in a source file named in the footnote. *Inferred* is a conclusion drawn from measured data. *Proposed* is a design or a decision not yet taken. *Unknown* is recorded as unknown and is not filled with an assumption. A reader who finds an unlabelled number should treat that as an error in this paper and not as a figure to use.

Executive summary

What the programme is. Universe connects four things Isuzu already holds or already receives: product knowledge (AIM), the composition of the parts business, the dealer self-assessment (IDS) and the market and fleet context (PRISM). It turns them into five tools a distributor or dealer opens by choice. The commercial argument is not that analysis is good. It is that the participant receives something it wants, and therefore keeps supplying the context that makes the next answer better.

What the programme is not. Routine availability enquiries, ordinary part and BVP lookups, day-to-day quotation handling and support administration stay in the existing business. They are not modules of Universe, not rewards for participation and not bargaining instruments for more data. The full boundary is in section 1.2.

The commercial problem being solved. ISZE has asked distributors for information for many years with insufficient visible value returned. A reporting obligation can start an exchange. Only a useful tool continues it. The 2025 arrangement tied a share of the normal distributor rebate to a major-KPI submission; that is the floor, not the mechanism.

The three decisions on the table this month.

Decision	Recommendation	What has to be true first
Fund campaign support	A named line of **€60,000 to €90,000** inside the existing €100,000 route, with a minimum campaign size of €150,000 of eligible billing	The campaign-selection rule is agreed and the first eligible campaign is named
Approach ten dealers	Yes, as designed in chapter 8: arrive with a finished own-business review and ask for correction, not for data	A prepared review exists from data already held
Build first	AIM Commercial Atlas and IDS Development Studio	The classification release is pinned to a named file and version

What the paper deliberately does not claim. No realised return. No approved budget. No forecast of incremental sales. No participant has accepted anything. The one place where the paper quantifies what the investment must earn is chapter 4, and it states the hurdle rather than a predicted outcome.

1. The commercial promise and the scope boundary

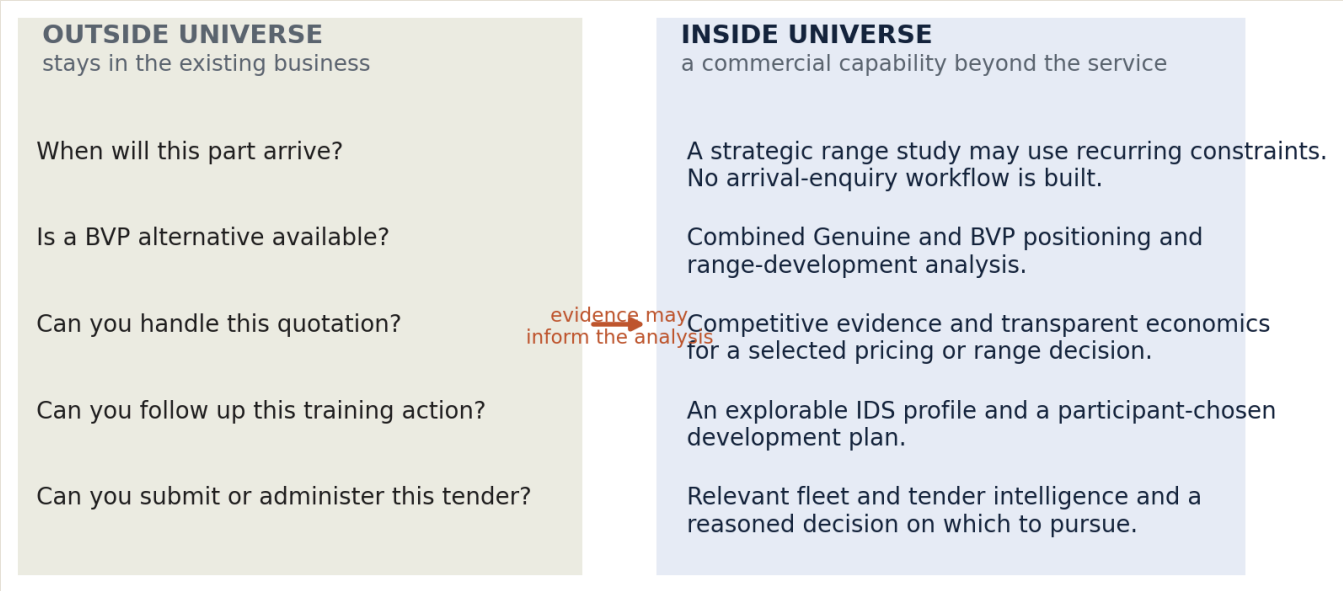

Figure 2. A normal service stays a normal service. Evidence from it may inform an agreed analysis; its workflow does not become a module.

1.1 The promise

Universe should give distributors and dealers tools that change how they understand and develop their parts business. The user discovers a range issue, understands a commercial movement, compares alternatives or chooses an improvement directly in the tool. Opening a request for somebody else to answer is not the defining interaction.

The participant return comes first. A distributor receives a clearer basis for national and network priorities. A dealer receives a useful view of its own supported business and a set of development choices it controls. ISZE receives better product and market understanding through an exchange the participant can judge valuable in its own right. More purchases from ISZE alone do not establish that a dealer gained anything.

1.2 The scope boundary — what Universe is not

A normal service is not a reward for participation, and participation is not the price of a normal service. No participant should have to provide sales history, workshop records, margins or customer details to receive the service it should already receive.

Outside Universe — stays in the existing business	Inside Universe — a commercial capability beyond the service
When will this part arrive?	Recurring, evidenced constraints may inform a strategic range study. No arrival-enquiry workflow is built.
Is a BVP alternative available?	Combined Genuine and BVP positioning, product composition and range-development analysis.
Can you handle this quotation?	Competitive evidence and transparent economics for a selected pricing or range decision.
Can you follow up this training action?	An explorable IDS profile and a participant-chosen development plan.
Can you submit or administer this tender?	Relevant fleet and tender intelligence and a reasoned decision about which opportunities to pursue.

The test is not whether a normal service can be made more sophisticated. It is whether the proposed tool adds a commercial capability beyond that service, helping a user see something materially useful, compare a choice or evaluate an initiative without creating a parallel operational process.

Keep the evidence when it improves the analysis. Do not import the day-to-day service into the product.

1.3 Why the boundary matters commercially

Two reasons, and the second is the one that decides whether a distributor says yes.

First, scope discipline protects the pilot. A programme that also answers availability questions is judged on availability response times, and it will lose that comparison against a system that already does it.

Second, the boundary is the offer. The sentence that changes how a distributor's parts manager reads the approach is: *we are not asking you to feed a support desk, and the support desk does not get better or worse depending on what you send us.* That is what distinguishes this from the data requests of the past several years.

---

2. The portfolio

Figure 3. Four foundations, five tools, one class of decision. Each tool uses only the evidence relevant to its own question.

2.1 Five tools, five questions

The tools answer different questions, and a participant usually starts with one of them. A single monolithic application would force every user through the same opening screen and would make the first experience depend on evidence the participant may not have.

Tool	The question it answers	Primary evidence	Designed for
AIM Commercial Atlas	What is really changing in my parts business, and where?	Purchasing history and product classification	Distributor parts manager, dealer principal
IDS Development Studio	What should I improve, and what has moved?	Dealer self-assessment and development records	Dealer principal, distributor network manager
Range & Campaign Planner	Which products belong in this initiative, and for whom?	Atlas selection plus account coverage	Distributor commercial lead
Pricing & Margin Lab	What does this commercial trade-off do to revenue and margin?	Comparable evidence and stated unit economics	Distributor commercial lead, ISZE commercial team
PRISM Market Intelligence	Where should we concentrate effort?	Historical fleet and source-dated opportunities	Distributor management, ISZE commercial team

2.2 The three developed applications

Three applications show the portfolio doing commercial work. They are examples of what the programme enables, not a closed catalogue.

Coordinated tenders. A distributor qualifies a local opportunity; the relevant Isuzu entities assemble a combined vehicle and aftersales proposition; headquarters receives a decision brief that makes the requested decision unmistakable. The value is a stronger joint proposition and less reconstruction between functions.

IDS development progress. The dealer explores its actual assessment, chooses a development priority with its distributor, records milestones with evidence, and sees progress separately from any score. The value is that the

assessment becomes a management tool rather than an archive.

Deal of the Day. ISZE helps a distributor prepare a specific, time-limited commercial offer: a reasoned product selection, a relevant audience, transparent economics and a way to learn from what follows. The value is in the preparation behind the offer, not in the discount.

2.3 What connects them

A common selection — entity, account, period, product range, source basis, permitted audience — lets a user carry a meaningful selection from the Atlas into a range plan or a pricing scenario without reconstructing it. An IDS plan need not use pricing data. A pricing study need not use an assessment.

Connect the tools because the next decision becomes better, not because every component needs an arrow to every other component.

---

3. Why product detail, shown on real numbers

3.1 A total describes scale. Detail describes where to act.

A distributor can have a stable parts total while the composition changes considerably. Some ranges expand, others are bought less often, and a change in mix conceals a change in quantity. A dealer may see these movements locally without the classification or the wider context needed to interpret them.

Figure 1 is the whole argument on one chart. ISZE parts billed to Isuzu Truck UK in the brake-pad source category fell from €347,389.58 in calendar 2024 to €302,366.25 in calendar 2025, a reduction of €45,023.33 or 13.0%. Recorded quantity fell from 4,562 to 3,402, a reduction of 25.4%. *Measured* against the supplied source-category aggregate, snapshot 19 September 2026; arithmetic rechecked 23 September 2026.

Value fell less than volume. A revenue-only view would suggest a demand problem, a quantity-only view would suggest a pricing problem, and neither alone tells a distributor where to look. The contextual fleet is 22,389 ITUK trucks on the stated calendar-2025 spend-per-truck basis. It is not the eligible population for every pad reference, and it is not divided among dealers.

3.2 Where the change sits

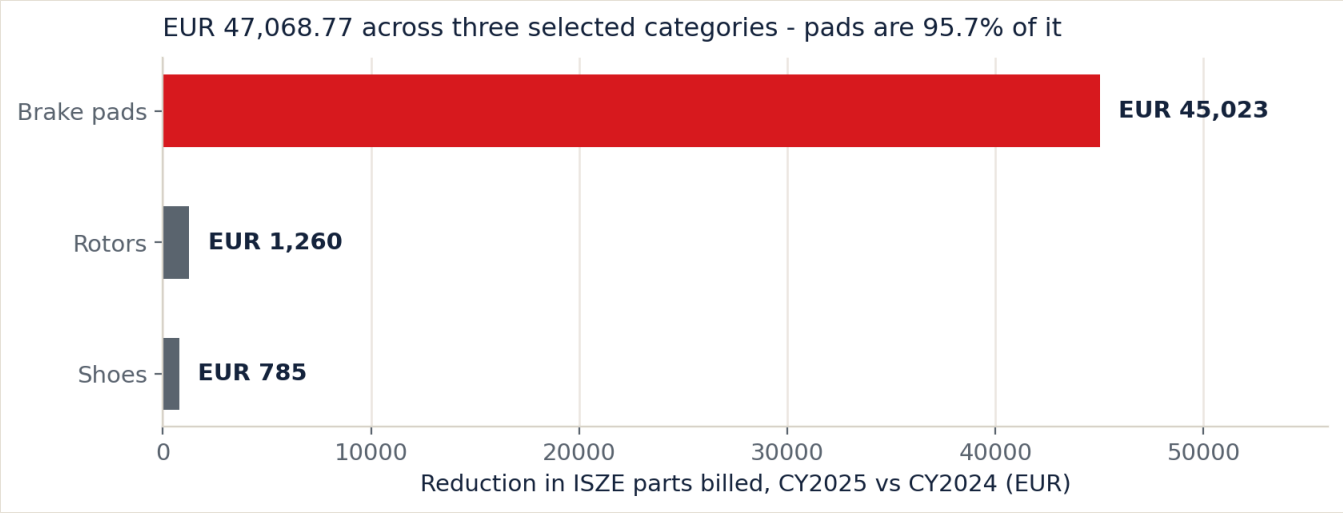

Figure 4. Magnitude of billing reduction across three selected ITUK source categories, CY2025 vs CY2024. Measured.

Across the three selected source categories — brake pads, rotors and shoes — the combined reduction is €47,068.77, of which pads account for 95.7%. *Measured*, same source and period.

This changes the starting decision from "braking products are down" to "brake pads are down". It does not support applying one remedy to every braking product, and it does not make the reduction recoverable revenue.

3.3 Genuine and BVP are one commercial offer

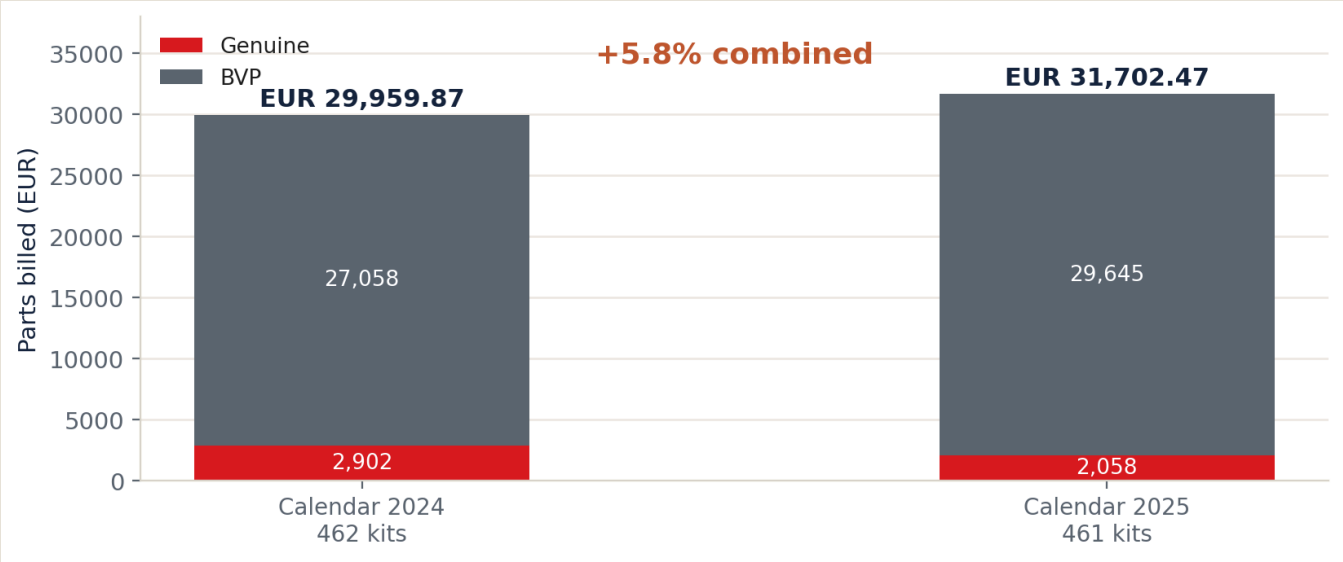

Figure 5. ISZE parts billed to I Motors, clutch-kit source category, full calendar years. Measured. Quantity was almost unchanged: 462 kits to 461.

For I Motors (Portugal), combined clutch-kit billing rose from €29,959.87 in calendar 2024 to €31,702.47 in 2025, up €1,742.60 or 5.8%. Genuine billing fell from €2,901.92 to €2,057.86 while BVP rose from €27,057.95 to €29,644.61. Recorded quantity was almost unchanged: 462 kits in 2024, 461 in 2025. *Measured*, same source and period.

A Genuine-only view would have suggested a recovery campaign for a line whose total business grew. The tool exists to prevent that mistake as much as to find opportunities. The 8,176-vehicle Portuguese context is a market figure on the supplied basis; it is not the eligible fleet for these kits, and it is not divided among dealers.

3.4 Where the concession actually sits in the network

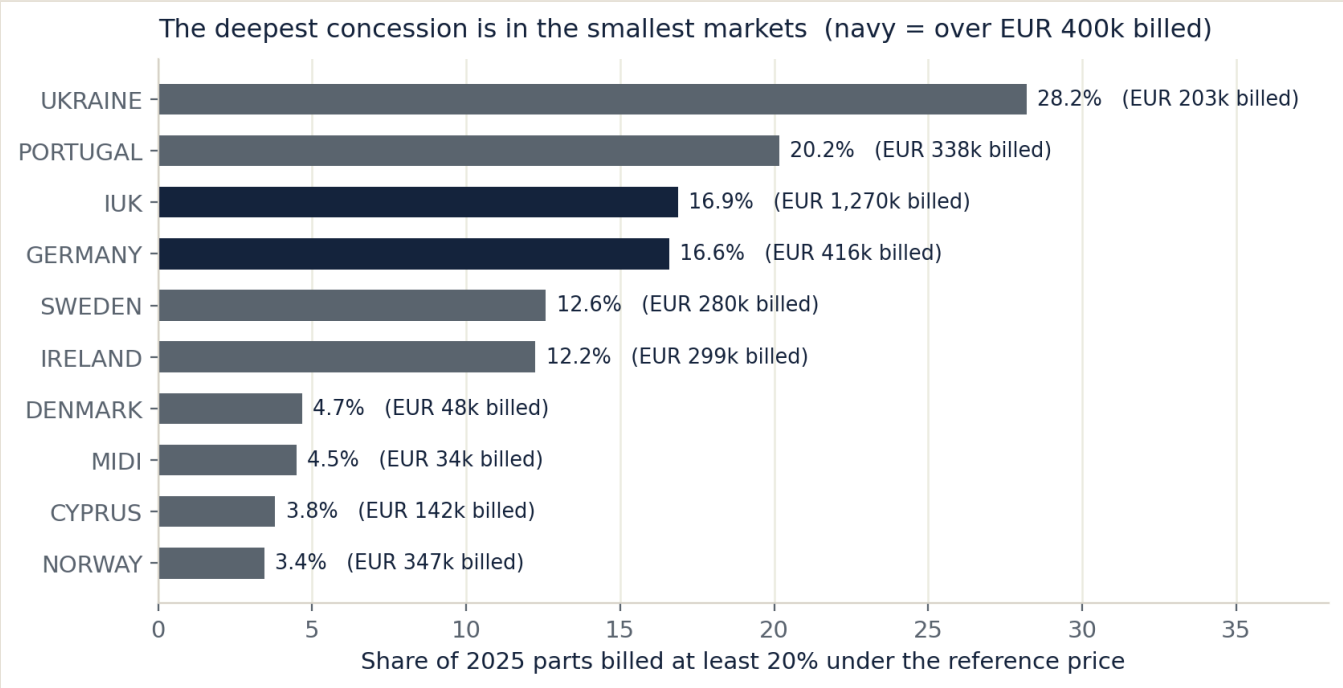

Figure 6. PMS lines carrying a reference price, 24 distributors. The ten largest deep-discount shares are shown. Measured.

Measured. PMS billed €6.65M across 24 distributors in 2025. Of that, 8.4% (€558,851) sat at least 20% under the reference price and 2.8% at least 30% under. In 2024 the same shares were 13.0% and 4.0% of €7.11M. The reduction in deep-discount share from 13.0% to 8.4% is a real and favourable movement.

It is also why a campaign-support mechanism has to be designed carefully, and the chart shows the trap. The distributors with the highest deep-discount share are not the largest ones: Ukraine 28.2% of €203k, Portugal 20.2% of €338k, IUK 16.9% of €1.27M, Germany 16.6% of €416k. A programme that pays per campaign without a size floor would spend most of its money in the smallest markets. Chapter 4 sets the floor.

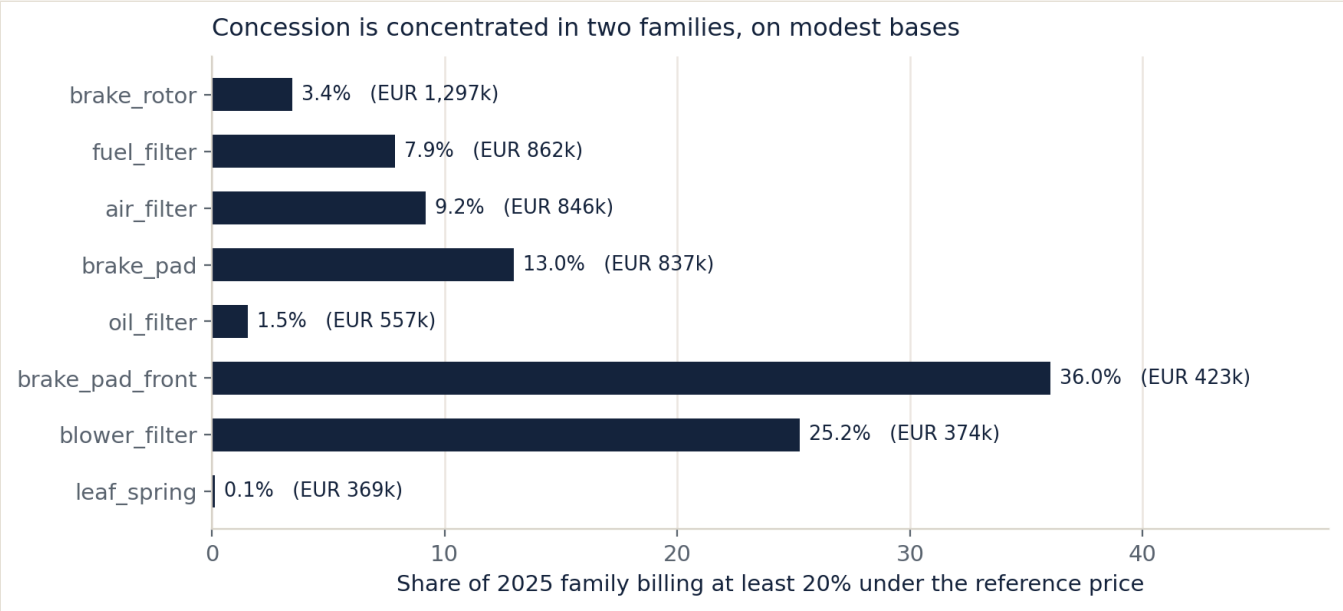

Figure 7. The eight largest PMS families by 2025 billing. Measured.

Measured. Two observations matter commercially. Brake-pad-front (36.0% of €423k) and blower filter (25.2% of €374k) carry large deep-discount shares on modest billed bases, which is the shape of a handful of large deals

rather than a broad pricing position. Brake rotors (3.4% of €1.30M) and oil filters (1.5% of €557k) carry almost none, which means their pricing is settled and their opportunity, if one exists, is not price.

---

4. The economics, and what the investment must earn

This is the chapter the funding decision rests on. It states four things: the denominator, the hurdle, the price of a dealer, and what campaign support should cost. It does not forecast a return.

4.1 The denominator

Basis	Value	What it is
Network parts billed to distributors, calendar 2025	€32,381,311.55	GPS parts billed across 22 distributors on the supplied basis
Of that, the 18 markets carrying a fleet figure	€30,756,771.61	Same source, rows with a vehicle-in-service count
The €100,000 route as a share of one year's network billing	0.31%	Arithmetic on the lines above
The €300,000 route on the same basis	0.93%	Arithmetic on the lines above

Measured, GPS distributor file, 2025 rows; arithmetic 23 September 2026.

The programme is therefore proposing to spend between three-tenths of one percent and nine-tenths of one percent of a single year's parts billing. That is the correct size for a pilot and the wrong size for a platform build. It also means the programme does not need to move the whole business to justify itself, and it must not be presented as though it will.

4.2 The hurdle: how many successful actions the money implies

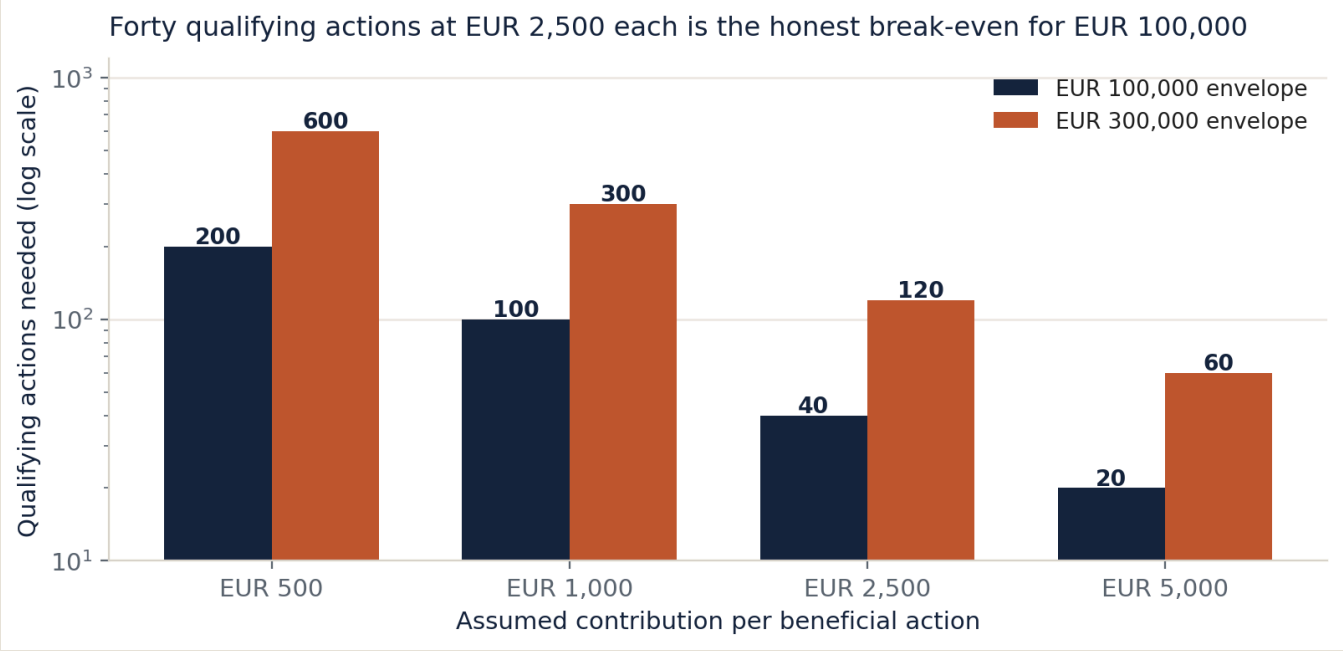

Figure 8. Qualifying actions needed to cover each envelope at four assumed contribution levels. Hypothetical arithmetic on stated inputs, not a forecast of dealer profitability.

If a beneficial action is worth €500, the €100,000 envelope requires 200 of them and the €300,000 envelope requires 600. At €5,000 per action, the same envelopes require 20 and 60. *Proposed and hypothetical arithmetic*; contribution per action is an assumption, not an estimate of dealer profitability.

Two consequences follow, and they are the reason this section exists:

- **A ten-campaign pilot is evidence, not a return.** Ten campaigns at €2,500 of contribution each is

€25,000 against a €100,000 envelope. The pilot's job is to establish whether the mechanism produces qualifying actions at all.

- **The honest break-even needs forty qualifying actions** at €2,500 contribution per action. That number

belongs in the funding discussion, not in a footnote after approval.

The hurdle is higher again when internal effort and continuing operation sit outside the envelope. Report the cash-only comparison and the fully costed comparison separately.

4.3 The price of a dealer

Dealer basis	Count	Consequence for the €15,000 enablement line
Dealers with a recorded IDS assessment in the ISZE network file	519	€28.90 per dealer if spread across the known estate
Portugal only	16	€937.50 per dealer if confined to the pilot market
ITUK and Portugal together	60	€250.00 per dealer
IDS networks represented in the file	19	France 84, Spain 45, UK CV 44, UK LCV 43, Italy 41, Norway 38, Belgium 34, Greece 34, Israel LCV 29, Poland 23, Switzerland 22, Denmark 20, Hungary 19, Portugal 16, Romania 15, Netherlands 9, plus one each in Malta, Cyprus and Luxembourg

Measured, ISZE IDS dealer network file of 20 September 2026, 519 rows across 19 networks; arithmetic 23 September 2026.

This table decides whether dealer enablement is a programme or a gesture. €15,000 spread across 519 dealers buys nothing that survives contact with a dealer principal. €15,000 spent as twenty-five accepted setup tasks at €600 in two pilot markets buys twenty-five completed onboarding experiences. The recommendation in chapter 9 is the second.

4.4 What campaign support should cost

The mechanism matters more than the headline. Two structures are worth testing and three are not.

Mechanism	Additive by construction	What it costs on a €120,000 campaign base	Recommended
Unit concession on additional-only volume against a documented baseline	Yes	20 additional units at a 5% concession on a €30 gross profit is about €120	Test first
Fixed campaign contribution paid on eligible campaign activity	No	Up to the fixed amount	Test
Unit concession on all campaign volume including the base	No	Five times the additional-only cost on the same volume	Do not use as standard
Payment per submitted record or per disclosed field	No, and it rewards disclosure	Scales with data, not with decisions	Do not use
Prize or award for the largest sales total	No	Cannot be compared across business sizes	Do not use

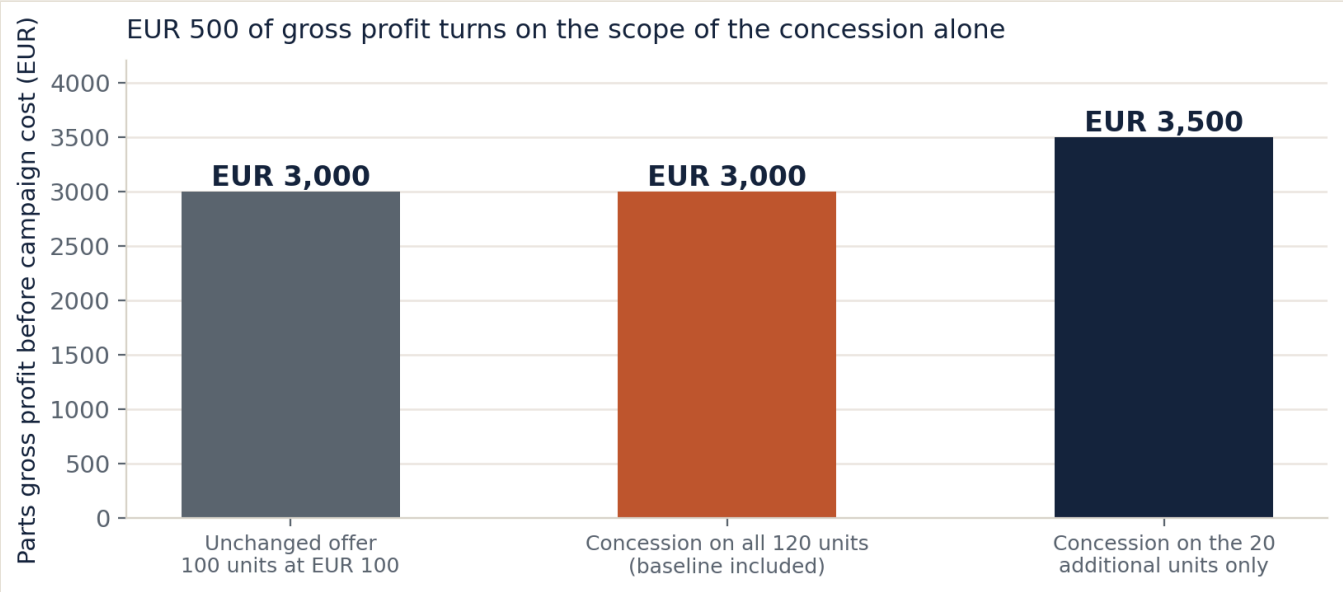

Figure 9. Hypothetical arithmetic: 100-unit baseline at EUR 100 net and EUR 70 parts cost, 20 additional units, 5% concession. Not an Isuzu price, offer or forecast.

The arithmetic is the strongest single argument for an additional-only structure. On a 100-unit baseline at €100 net with €70 parts cost, a 5% concession applied to all 120 units after the campaign produces €3,000 of parts gross profit. Applied only to the 20 additional units, with the baseline retaining its original price, it produces €3,500. The €500 difference is scope alone and assumes no demand response. *Hypothetical arithmetic* on stated inputs, not an Isuzu price, offer or forecast.

4.5 What the envelope needs to cover

Line	Proposed	Basis	What has to be demonstrated
Campaign support	€35,000 to €50,000	8 to 12 campaigns at €2,500 to €5,000, against the minimum-size filter	Qualifying campaigns exist, and contribution is measured on the same scope before and after
Dealer enablement	€15,000 to €25,000	25 to 40 accepted setup tasks at €600	A documented task, an accepted deliverable, and the later eligible-use test
Independent evaluation	€10,000 to €15,000	Two waves at 90 and 180 days, including returns and displacement	The result is published whether it is favourable or not
Total additional campaign cash	**€60,000 to €90,000**	Inside the existing €100,000 route, without drawing on the engineering or assurance lines	—
Internal analytical preparation	Not costed here	Must be shown as internal time, not assumed free	Named owner and a stated allocation

Proposed allocations against the mechanism in this chapter. They are a recommendation inside the existing €0 / €100,000 / €300,000 planning envelopes, not a new budget request and not an approved expenditure.

What the investment must earn, stated once. At the paper's own hurdle of €2,500 contribution per beneficial action, the recommended €60,000 to €90,000 needs 24 to 36 qualifying actions before internal costs. The pilot will not produce that. It will produce the first real measurement of the qualifying rate, and that rate is the number on which any expansion should be decided.

---

5. AIM Commercial Atlas

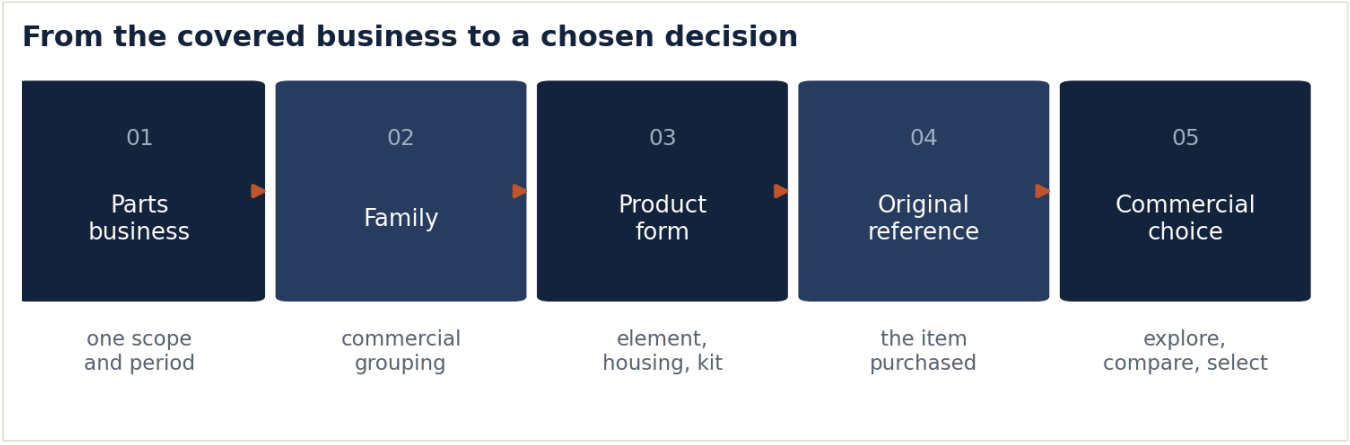

Figure 10. Proposed analytical sequence. Each stage retains its own source period and evidence.

The Atlas turns original part references into a navigable commercial range. The user moves from distributor or purchasing-account activity into families, product forms and exact references, keeping the selected period and sales stage intact.

The depth comes from keeping distinctions visible: value against quantity where monetary evidence exists; continuing against newly active references; Genuine against BVP; product form such as element, housing, assembly

or kit; and the contribution of individual references to a family movement. A validated successor can be shown beside the original transaction without erasing the code that was actually purchased.

A product is not an opportunity merely because the participant has not bought it. The Atlas distinguishes no recorded purchase from a documented range gap, a coverage exclusion, a number change and an irrelevant application.

Figure 11. Proposed product-form distinction. It prevents an average unit price from describing a mix change as a price change.

Element, housing, assembly and kit can sit near each other in a product tree while having very different prices and use. Combining them into one average unit price describes a changing mix rather than a change in price. A missing relationship stays a visible gap in the analysis; it is not filled with a plausible match based on similar wording.

The result is a saved commercial selection: the source-defined range, the observed pattern, alternative explanations, missing evidence and a proposed choice. The user may retain the range, investigate further, prepare a campaign, compare economics or take no action.

---

6. IDS Development Studio

The studio turns the dealer self-assessment into a practical development tool rather than a questionnaire archive or an action-chasing service. The user explores the actual assessment, sees the meaning behind each section and selects a development priority it controls.

The first useful output is an understandable assessment profile: actual question wording, response, section, questionnaire version and available assessment period. Missing, unanswered and inapplicable items remain distinct. An import date must not replace an absent assessment date. Strengths are shown as visibly as weaknesses.

A comparison may show a dealer's position against an appropriate, permitted group only where the questionnaire and scoring basis are compatible. There is no distributor audit score and no new universal league table.

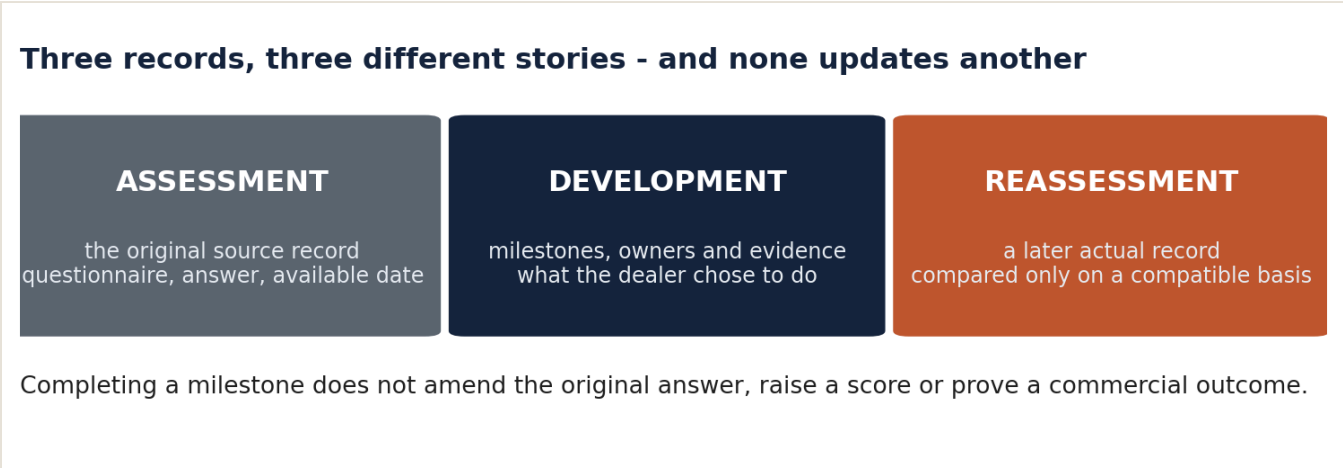

Figure 12. Proposed record structure. No actual dealer score, date or progress is represented.

Progress has three separate meanings, and the tool never lets one update another: completing a development initiative shows the agreed work occurred; a later comparable assessment shows a change in recorded answers; a commercial improvement requires its own measurement. The tool therefore remains useful before a second assessment exists.

---

7. Range, pricing and market tools

Figure 13. Proposed decision gate. A missing purchase is not evidence of unmet demand.

7.1 Range & Campaign Planner

The planner takes an analytical selection and turns it into a proposed range or campaign decision: which products belong in the initiative, which participant or vehicle segment is relevant, how the Genuine and BVP offer should be positioned, and what would demonstrate that the initiative was useful. Its output is a campaign brief the participant can use. Execution stays in the existing business; Universe does not become an email-marketing system, an order platform or a quotation desk.

7.2 Pricing & Margin Lab

The lab combines supported competitive positioning with user-controlled scenarios. It is a tool for evaluating a selected offer or range, not a service for answering routine quotations.

Parts gross profit is defined as revenue less the parts purchase cost of the quantities sold. Freight, duty, overheads, distributor rebates and other operating costs are excluded from that particular measure, and a separate initiative-economics view considers additional costs once without silently changing the definition.

The quantity needed to preserve revenue or gross profit is an arithmetic threshold, not a forecast. A participant may test its own quantities or supported commitments without claiming estimated elasticity. Sensitive selling prices and margins further down the channel are not mandatory contributions to ISZE: a private calculation can return only a permitted aggregate, or no shared financial result at all.

7.3 PRISM Market Intelligence

PRISM separates measured parts billed, historical vehicles in service and modelled expected demand. Spend per truck is a measured purchasing rate on a stated fleet basis. Target spend and service expectations depend on assumptions and technical applicability. A modelled gap is not automatically recoverable sales and is not a programme business case.

A national vehicle total cannot be allocated to dealers by sales, visits or geography. A part that serves several vehicle classes remains shared unless exclusive applicability establishes the attribution. A workshop sample is not a dealer's complete fleet.

For tender intelligence, the useful output is a qualified shortlist: source and observation date, actual scope, known deadline, relevance and a decision about pursuit. A tender's overall value is not expected Isuzu parts revenue, and an award is not parts billed.

---

8. Participation: will they actually join?

This chapter states what dealers and distributors are being asked to do, what they receive, and how likely each step is to happen. The score is a judgement on this design, not a measurement, and it is given so that the design can be argued with.

8.1 The dealer's position

The dealer's reason to participate cannot be a reporting obligation. ISZE has no direct commercial relationship with the dealer, the distributor already receives the dealer's purchasing information, and the dealer is being asked to spend time at a parts counter where a customer is standing.

Figure 14. Proposed participant journey. No dealer has been invited and no access has been accepted.

What the dealer receives that it cannot get today

Return	Why it is hard to get otherwise
Its actual IDS answers, in the real question wording, with section and version	The dealer has the questionnaire but not an explorable view of its own record
A development priority it chooses, with milestones and evidence it controls	Existing assessment rounds give a score, not a plan the dealer owns
A prepared own-business review of its recorded purchasing, with a correction route	Today this arrives, if at all, as a national or distributor-level summary
A visible record of who owes the next step, including ISZE and the distributor	Today the dealer cannot see when it is waiting on someone else

The first two are the strongest dealer assets and they are under-used in the current design. Of the 519 dealers in the ISZE network file, 334 carry a recorded IDS score today. Figure 15 shows their distribution: a minimum of 0, a maximum of 100 and an average of 77.5. That is roughly two-thirds of the known estate with an individual result already on file, and it is the only place in this programme where ISZE holds something a dealer will want to look at that it cannot easily assemble itself.

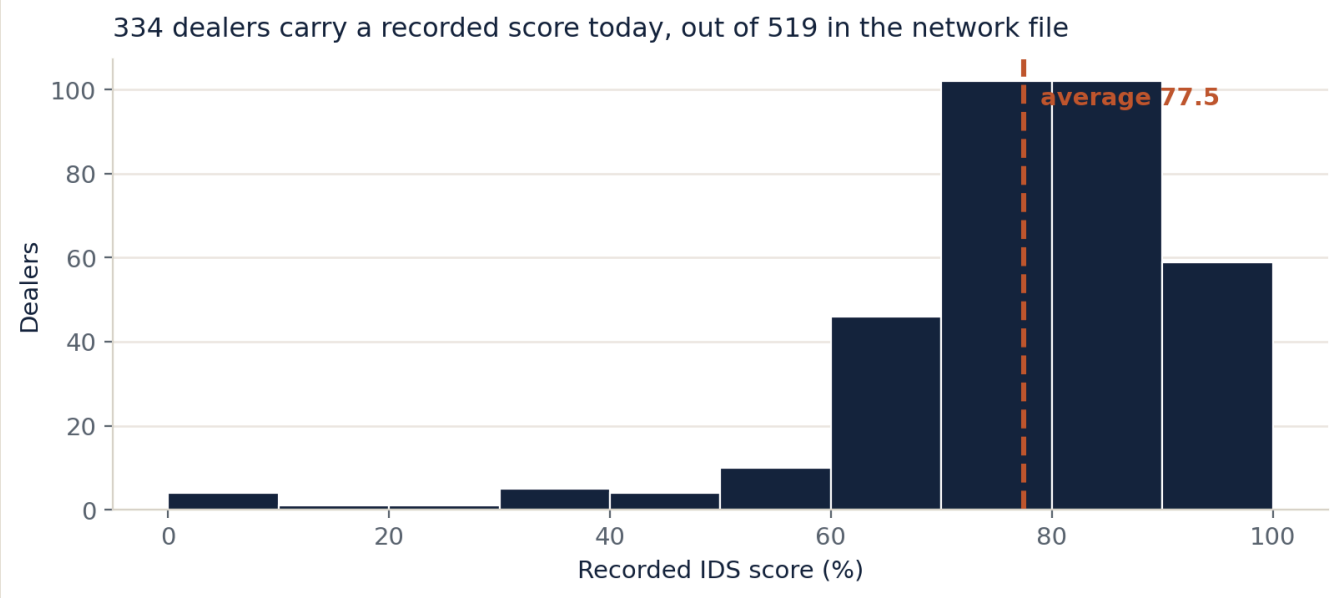

Figure 15. Dealer network file of 20 September 2026: 519 rows across 19 networks, of which 334 carry a score. Measured.

How the dealer joins, step by step

1. **Approach through the distributor.** The distributor chooses the invitation. ISZE does not approach a dealer directly.
2. **Arrive prepared.** The first item opened is a review built from information already held. There is no form, no portal registration and no upload in the first session.
3. **Ask for correction, not for data.** The dealer confirms or corrects one interpretation. "Your reading is wrong" and "no action is needed" are both successful outcomes.
4. **Offer the IDS profile.** The dealer sees its own assessment in a usable form and chooses one development priority.
5. **Record the plan.** Milestones, owner and evidence, with the record staying with the dealer.

6. **Propose the next eligible task, not the next report.** The repeat invitation depends on an actual commercial decision occurring.

Honest assessment of the first ten invitations

Step	Score /100	Why that number
Dealer accepts the first prepared review	55	Reasonable, because it costs ten minutes and arrives finished. It competes with a customer standing at the counter.
Dealer corrects the interpretation	70	Correction is low-cost and self-interested. This is the most reliable step in the design.
Dealer opens and uses its own IDS profile	65	The strongest hook in the programme: its own answers, in the real wording, with a priority it chooses.
Dealer returns for a second eligible task	30	No cash, no visibility gain, no recurring trigger. Habit does not form on goodwill alone.
Dealer shares anything beyond a correction	20	Requires a reason that has not yet been created. Nothing in the design currently supplies it.
Dealer joins as designed today	**45**	The design is credible in its first three steps and unproven after them.

What raises the dealer score

Three changes, in order of effect. **Make the IDS profile the opening, not a later step**, so the first thing a dealer sees is its own data rather than a supplier's reading of it. **Fund a bounded setup task**, so the dealer's own time has a price and the distributor has something to offer rather than something to ask for. **Make the return visible**, so the dealer can see the answer, the decision and who owes the next step, because invisible follow-through is what ended the previous data requests.

8.2 The distributor's position

The distributor's position is stronger and simpler. It already has an obligation to report. It already has a rebate linked to reporting. The change being proposed is what comes back.

Figure 16. Proposed participation design. Payment for data volume is excluded and ordinary service is never conditional on a contribution.

What the distributor receives

Return	Frequency	Decision it supports
Prepared national or network review	Monthly, after a usable submission	Which accounts and ranges deserve attention
Product detail behind a movement	On the selected case	Which references and product forms explain a change
A range or campaign brief	On the selected initiative	Whether to develop, narrow or protect the offer
A tender proposal framework	On a qualified opportunity	Whether to pursue and what support to request
A reviewed development record per dealer	On IDS work	Where to direct its own network-development effort

How the distributor joins

1. **A director-level conversation, not a data request.** The opening statement is that the recurring report is reused and nothing additional is required for the core review.
2. **Agree two or three definitions once.** Covered accounts, channels and products. These are reused rather than re-requested.
3. **Receive the first prepared review.** Built from data already supplied, with the question behind it stated.
4. **Choose one case.** One range, one account pattern or one campaign, with a named owner on the distributor side.
5. **Extend only where a case needs it.** Additional detail is requested for a defined purpose with a named recipient and a stated return.

Honest assessment

Step	Score /100	Why that number
Distributor accepts the opening	75	Cheap, adds no reporting burden, and the rebate floor already exists.
Distributor uses the review internally	45	Depends entirely on whether one review answers a question the distributor already had.
Distributor selects a case with a named owner	50	Requires management attention, which is the scarcest resource in a distributor's year.
Distributor shares account-level detail beyond the current report	35	Genuinely useful and genuinely sensitive. Needs the boundary in chapter 10 to be real, not promised.
Distributor uses Universe to develop its own dealers	40	This is the highest-value outcome and the one the design supports least well today.
Distributor co-funds participation	25	No precedent. Should not be assumed and should not be requested in the first year.
Distributor joins as designed today	**55**	A credible, low-cost start with an unproven second step.

What raises the distributor score

The gap between the 75 for accepting and the 45 for using is the whole problem. Two changes close it. **Answer a question the distributor already has**, rather than presenting a general capability, because a review that is merely

available is a review that is not read. **Make the distributor's own dealer development the visible output**, because that is the only framing in which the review serves the distributor's commercial interest rather than ISZE's.

8.3 The base rate, and what it means

519 dealer self-assessments exist today across 19 networks. That is what this network produces when an obligation is attached to a dealer-facing requirement. Anything in this programme that scores below that base rate needs a reason the participant can feel, and the only two reasons available are money and a visible improvement in its own business.

8.4 Do not do these

Do not	Why
Pay per submitted record, per row or per disclosed field	Rewards disclosure volume rather than useful work
Make ordinary service conditional on contribution	Turns a normal service into a bargaining instrument and destroys the premise
Build a public dealer league table	Turnover favours large businesses and self-assessment scores have different coverage
Ask for dealer resale prices by default	Not needed for the core review and the most sensitive item on the list
Approach a dealer directly	The distributor owns the relationship and the audience decision
Count logins or uploads as participation	Neither is evidence that a decision improved

9. What to build first, what to fund, and what to stop

9.1 The sequence

Stage	Result	Evidence to move on
1. Agree the scope and the portfolio	A clear five-tool portfolio and the written exclusion of routine services	This paper, the presentation and the showcase explain the same proposition
2. Pin the classification release	One named file, version and build date	Reproduce a selected family and product-form view from the pinned release
3. Open two prepared views	An Atlas view and an IDS profile, both prepared before the first invitation	A participant completes a real task and finds it clearer than the existing review
4. Run the dealer sample	Ten dealers across two markets, including one that is reluctant to add reporting work	Correction, useful output, total effort and reasons for non-use, all recorded
5. Run the campaign line	At least two qualifying campaigns against the agreed size filter	Contribution measured on the same scope before, during and after, including returns
6. Evaluate, then extend or narrow	A stated result, favourable or not	Real later evidence, effort and usefulness; not a rendered screen

No elapsed-week estimate from the earlier support-centred roadmap is inherited as a promise.

9.2 Funding recommendation

Adopt the existing €100,000 route and re-point its campaign element as chapter 4 sets out. In practice:

Recommendation	Amount	Note
Named campaign-support line	€60,000 to €90,000	Inside the €100,000 route; does not draw on engineering or assurance
Minimum campaign size to qualify	€150,000 eligible billing	Below this, a single campaign cannot produce enough contribution to justify its own preparation
Dealer enablement, spent as accepted tasks	€15,000 to €25,000	Not spread as a per-dealer entitlement
Campaign support named as its own line	Non-negotiable	The current position, that campaign support needs its own approved commercial treatment, is a control and not an answer
Route selection	Start at €100,000	The €300,000 route adds dealer enablement and resilience before the qualifying rate is known

9.3 The go / no-go and the stop condition

Go if, at the pilot review, a real participant completed a real analytical task, the output was correct on its source, and the participant can name the decision it changed. **No-go** if the only evidence is that a screen rendered, a file arrived, or somebody said the demonstration looked good.

It stops. If, after two eligible cycles, no participant can name a decision the tool changed, or if a confidentiality or identity weakness is found that cannot be closed, the programme stops. It does not pause, it does not add a report, and it does not broaden the participant population to look for a better sample. If the incentive that currently produces the file were removed tomorrow, the honest test is whether anyone opens the tool anyway.

---

10. Delivery, ownership and risk

10.1 Ownership

The business owner can define the commercial question, design the information exchange, prepare analytical examples and establish what a useful output should contain. Existing AIM, Atlas, PRISM and IDS work is inspected and reused where fit for purpose rather than reproduced as parallel calculations. Specialist work is bounded: access isolation, durable shared records, reliable imports, recovery, or an agreed connection to company systems. Each is a task with an accepted deliverable and a handover.

10.2 What no amount of code closes

There is no backend on this machine. There is no shared case service, no production identity and no attachment storage. The prototype deliberately refuses an authenticated identity rather than inventing authority, and says so on every result. A browser-side allowlist is not access control and is not described as one anywhere.

The access rules that matter — only the authorised distributor sees its selected accounts and terms, only the dealer sees its own permitted record, and no distributor sees another's submissions — are enforced by the operating application and by the contents of exports, not by hidden menus and filters. Until that is implemented and independently reviewed, the first shared use stays distributor-led and document-based.

10.3 Copyright and competition boundaries

Universe is a commercial programme offered by ISZE to European distributors and through them to dealers. Under the European motor-vehicle block exemption framework, agreements using market-share thresholds of 30% or 40% are valid until 31 May 2028, after which the motor-vehicle-specific regime lapses unless replaced. Nothing in this paper is a legal determination, and none of it has been reviewed for competition-law compliance.

Three design rules follow and are proposed as standing constraints:

- **No exclusivity in exchange for information.** Participation is not conditioned on purchasing, on range commitments or on refraining from a competing offer.
- **No price coordination between distributors.** Universe compares a distributor to its own history and to permitted aggregate context. It does not transmit one distributor's terms, plans or intentions to another.
- **No resale-price instruction.** ISZE sets its net price to the distributor. Universe does not prescribe, and does not retain, dealer resale prices.

This must be reviewed by the responsible function before any shared output is used with a participant.

10.4 Privacy and the data boundary

The recurring standard is price-free. Selling prices, resale margins, customer identities, vehicle identifiers, full inventory and workshop job cards are not silently added to it. Quantity-only data can support valuable analysis without becoming recorded resale revenue. Where a financial outcome is needed, a locally calculated aggregate may be sufficient, and an aggregate is not automatically anonymous.

Corrections have their own rule: a corrected submission replaces its declared predecessor for the affected scope, identical re-imports add no activity, annual controls are not added to monthly observations, and national controls are not added to their dealer detail.

---

11. What we measured, what we inferred, what we assume

11.1 Measured

Observation	Basis	Source
ITUK brake-pad billing €347,389.58 (2024) to €302,366.25 (2025); quantity 4,562 to 3,402	Full calendar years, source category	ISZE category-mix aggregate, snapshot 19 September 2026
Three selected brake categories fell €47,068.77; pads are 95.7% of it	Same period and basis	Same
Portugal clutch-kit billing €29,959.87 to €31,702.47 combined; Genuine €2,901.92 to €2,057.86	Full calendar years, source category	Same
Network parts billed to distributors 2025: €32,381,311.55 across 22 distributors	GPS parts billed, supplied basis	ISZE GPS distributor file, 2025 rows
PMS billed €6,654,582.64 in 2025; 8.4% of euro at least 20% under reference, 2.8% at least 30%	PMS lines with a reference price, 24 distributors	ISZE campaign-suspect summary, 2025
519 dealers with an IDS record across 19 networks; 334 scored, average 77.5	Dealer network file	ISZE IDS dealer network file, 20 September 2026

11.2 Inferred

Value fell less than volume in the ITUK pad line, which means mix, price and coverage deserve examination before any concession is considered. Combined Genuine and BVP grew in Portugal while Genuine fell, which means a Genuine-only view would have produced the wrong campaign. The distributors with the highest deep-discount shares are not the largest ones, which means a campaign programme without a size floor would concentrate in small markets.

11.3 Modelled, and labelled as such

The quantity thresholds, the contribution figures and the hurdle table are arithmetic on stated inputs. They are not estimates of customer response. Where a cost is unknown it is printed as unknown; an empty cost is not zero.

11.4 What elasticity evidence exists, and how weak it is

There is no reliable measured price response in the current evidence base, and the paper does not pretend otherwise. It is worth stating what has been measured, because silence lets a reader assume whatever responsiveness suits the conclusion being argued.

Product family, 2024 to 2025	Price effect on quantity	Reading
Maintenance service	Steeply negative, but with a large standard error and almost no explanatory power	Direction only. Not a usable elasticity.
Brakes	Flat to slightly positive, with a large standard error	Inconclusive.
Lubrication	Not identified, because the list-price movement was nearly uniform across the pairs	Use the median quantity move instead.

The measurement is of the stocking response from ISZE to the distributor, not dealer-market demand, and it does not control for demand shocks. Approximately €233,000 of the brakes change sits in price-up with volume-down, €172,000 in price-up with volume-up, and €335,000 in volume-down with price flat. *Measured*, year-on-year pairs on 2024 and 2025, direction and rough magnitude only.

The practical rule is therefore: **no scenario in this programme forecasts a demand response.** A threshold says what would have to happen. It does not say what will.

11.5 Not known, and printed as not known

The customer's reason for purchasing elsewhere. Whether a distributor's dealer network covers the vehicles that buy the part. The gross-profit effect of a range change before the campaign is run. The qualifying-campaign rate that chapter 4 needs. Whether a dealer will return after the first task.

---

12. Reference: measures

Term	Meaning in this paper
Parts billed	ISZE sales to the stated distributor on the stated source basis
Sales to dealer	The distributor's recorded onward purchasing stage, at its own source and period
Parts gross profit	Revenue less documented parts purchase cost of the quantities sold; freight, duty, overheads and distributor rebates excluded
Campaign contribution	Parts gross profit less additional campaign costs not already included
Reference price	The applicable list reference for the stated entity and period; a reference valuation is not a transaction
Deep concession	A billed price at least 20% under the reference price, on a line with a reference price
Eligible fleet	The vehicles supported by the selected application evidence, never allocated from a national total
Qualifying campaign	A campaign whose eligible billing base exceeds the stated minimum size
Progress	Project implementation, which is not a reassessment and not a commercial outcome
Measured / inferred / proposed / unknown	The four evidence labels used throughout this paper

13. Reference: periods, populations and identities

Keep calendar and fiscal periods distinct: Isuzu's fiscal year runs April to March, while the historical examples here compare full calendar years. The billing reference for 2026 runs through 30 June 2026 and is a half year, not a full-year observation. A missing month is not filled with zero.

ITUK is not IUK, and UMI is not UTI. Country aggregation must not silently combine their fleets or purchasing behaviour. A purchasing account is not automatically a physical workshop, and a dealer company can have several sites. The original transacted part reference remains available alongside its classification and any separately governed successor relationship; a later relationship must not silently rewrite a historical transaction.

14. Reference: sources and revision record

Code	Source and use
U	Business-owner scope instruction, 22 September 2026: distinctive commercial tools, with ordinary availability, BVP and day-to-day support outside the programme
W	Universe White Paper 1.1 revised, 21 September 2026. Source for analytical, participation and access distinctions
C	Commercial and participation revision, 22 September 2026. Source for participation history, category examples and funding alternatives
R	Implementation roadmap, 22 September 2026. Source for reuse and acceptance principles
M	Supplied category-mix aggregates, snapshot 19 September 2026. Source of the ITUK and Portugal comparisons
N / O	ISZE numerical and operating context, 19 September 2026
A	AIM Pricing Decisions component, confirmed financial rules, 22 September 2026. Source of the parts gross-profit definition
P	PRISM showcase, interaction reference only. Its historical totals and projections are not imported
3.0	Universe Commercial Vision 3.0, 22 September 2026. Withdrawn and superseded by this edition
T	Universe Commercial Tools Edition, 22 September 2026. Source of the scope boundary, adopted here. Its five-tool portfolio is adopted; its separate existence as a parallel product story is withdrawn
E	New proposals in this edition, 23 September 2026

New in this edition, and the source of the change. The scope boundary adopted from [T] and absent from [3.0]. The single portfolio and the decision route under "How to read this". The data-led chapters 3 and 4, including the network concession picture, the hurdle table and the per-dealer price. The participation assessment and the base-rate comparison in chapter 8. The elasticity disclosure in 11.4. The stop condition in 9.3.

Design and production. Charcoal `#24282C`, Isuzu red `#D71920`, navy `#15233C`, terracotta `#C0552D`, Arial or a metrically compatible substitute. No font files, raw billing or full price lists accompany this paper. The charts are generated from the named source files at build time; the generator and its checks sit in `_build_30`.

Prepared 23 September 2026. Withdrawn documents remain on disk for reference and must not be quoted as current.
