ISUZU

The Case for a European Tender Approach

Public fleet procurement is the one channel where genuine parts revenue can be secured before the competition arrives. Today, Isuzu in Europe has no approach to it.

> **What this paper asks for.** Not budget. Not headcount. It asks management to recognise that fleet opportunities currently reach us by accident, and to adopt one instrument we already own — the **SPA study**, which states the situation before and the situation after — as the standard way every fleet opportunity in Europe is evaluated, approved, and measured afterwards.

CONTENTS

What Is In This Paper

01	**The Case in One Page**	What is missing, and the one line that proves it
02	**The Prize**	Why R&M contracts are the most valuable category we ignore
03	**The Real Cost of Doing Nothing**	What the current position costs us, in euro
04	**The SPA Study as the ROI Instrument**	The method, proven on a live deal worth €211,000
05	**Are We Watching Where the Money Is?**	Coverage against revenue, market by market
06	**Sizing the Opportunity**	Fleet units converted to parts-revenue equivalent
07	**Why R&M Is Hard at Our Size**	Partner scarcity, fragmentation, and speed
08	**Working With Vehicle Sales and IML**	The minimum connective tissue
09	**What the Competition Already Does**	Ford Pro and the rest of the segment
10	**This Year's Target, and the One After It**	Why SPAs deliver FY27 but not the long-range plan
11	**What We Are Asking For**	Four decisions, none requiring budget
12	**Appendix — Platform Status**	What works, what is dark, and what it cannot tell us

> **A note on the numbers.** Every figure in this paper is traceable to either the reviewed FY2027 network budget, the live tender platform run of 24 August 2026, or a named internal study. Where a figure is carried from an earlier analysis and has not been re-verified, it is marked as such rather than presented as current.

SECTION 01

The Case in One Page

Every year hundreds of European public authorities tender for light commercial vehicles, pickups and fleet maintenance contracts — the exact categories where Isuzu competes. They are published in advance. They are the most predictable commercial opportunities available to our network.

Isuzu has no European approach to them. That is not a criticism of any individual or distributor. It is structural: no owner, no routing, no standard evaluation, no record of what we won or lost and why. Opportunities that do reach us reach us by accident.

“This is the first time we have received such a request from the Vehicle Team.”

Our supply organisation, July 2026 — responding to a part-number request for a 173-vehicle public fleet tender. A tender of that size arriving as a first-of-its-kind enquiry, in 2026, is the whole argument in one line.

What management is entitled to ask, and what we can answer today

The question	Answerable today?
How many fleet tenders in Europe are relevant to Isuzu right now?	**Yes** — 680 scored opportunities, 204 at action tier, across 26 markets
Who owns each one?	**No** — ownership is suggested by a tool, never assigned
What did the last price concession we granted actually return?	**Partly** — one market ran a proper before/after study; it is the exception
Why did we lose the last fleet tender?	**No** — no debrief requested, no loss reasons recorded
Which public fleets already run Isuzu, and when do they re-tender?	**No**

The instrument already exists. In July 2026 a Polish fleet tender was evaluated properly: incremental parts turnover quantified, the attached R&M contract valued over its guaranteed life, and the total put in front of the approver *before* the concession was granted. That study is the template. It is ROI-native — situation before, situation after — which is exactly how every other investment in this company is judged. **The ask is to make it standard, not exceptional.**

€19.1M

of FY27 network budget has **zero** action-tier tender visibility

€211K

returned by the one fleet SPA we evaluated properly

50

action-tier opportunities sitting unworked in France, Spain and Italy

SECTION 02

The Prize

Public procurement contains two tender types relevant to us: vehicle purchase, and Repair & Maintenance. The second is far more valuable to a parts organisation, and it is the one consistently overlooked.

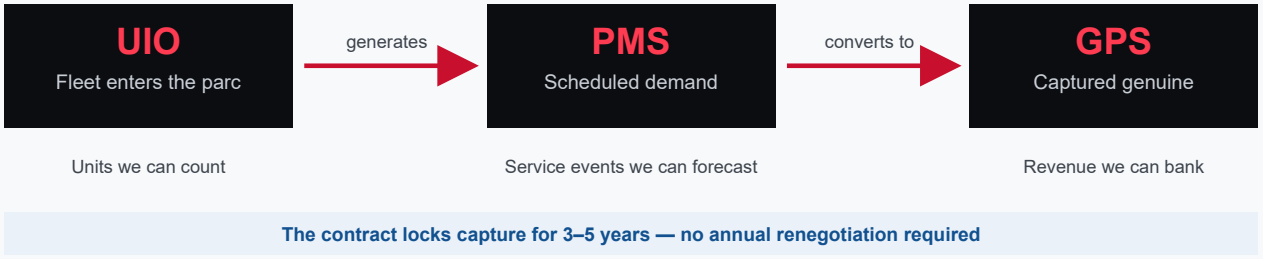

Advantage of an R&M contract	Why it matters to ISZE
Predictable, recurring revenue	Contracts run three to five years. Parts demand for the covered fleet is locked in for the duration.
No leakage during the contract	An authorised holder sources through the authorised channel for every covered vehicle — the capture problem disappears for that fleet.
Lock-in	Switching maintainer mid-contract is disruptive and contractually penalised. The incumbent usually wins the renewal.
It covers the parc we already built	Every vehicle in the fleet, not just new units. No additional vehicle sale is required to earn the revenue.
Renewal visibility	Contracts must be re-tendered on expiry. The platform sees the renewal before it is awarded, giving an incumbent distributor warning to defend it.

What a fleet win does to our three headline measures

A tender win is not only a parts order. It moves every KPI this organisation reports on, in the same direction, at the same time.

One R&M contract moves all three measures at once

and unlike a price increase, it grows the base rather than squeezing it

The contract locks capture for 3–5 years — no annual renegotiation required

> **This is the structural difference.** Price increases and parts-share campaigns raise revenue from a parc we already serve — they optimise the existing base. An R&M win *enlarges the served base*, and holds it for three to five years. Both are needed. Only the second changes the trajectory.

SECTION 03

The Real Cost of Doing Nothing

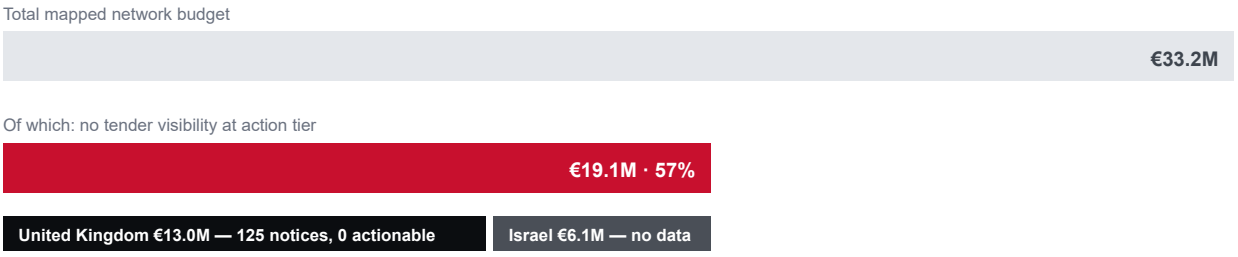

Continuing without a tender approach is not a neutral choice. It is an active decision to cede a channel our competitors already work systematically. The costs are quantifiable.

Cost	Scale	Basis
Revenue with no tender visibility	**€19.1M**	UK and Israel carry 57% of the FY27 network budget and return zero action-tier opportunities
Largest unworked market bloc	**50 opps**	France, Spain and Italy — 121 notices, 50 at action tier, 85 R&M-linked, no working route
Genuine parts revenue gap, UK	€3.5M+	Internal gap analysis; carried forward, not re-run this cycle
Long-range gap not covered by market growth	~€8.9M	Difference between the FY2031 ambition and what market growth alone delivers
Each R&M contract lost	3–5 yrs	Parts revenue ceded to an independent operator, with that operator favoured at renewal

The compounding problem. When a public authority tenders for fleet maintenance and the winner has no relationship with an authorised Isuzu dealer, that maintainer sources from whichever wholesaler supplies fastest. Once established, the relationship is operationally embedded — the garage knows the part, the wholesaler knows the account, the invoicing is set up. Breaking it three years in requires a material price or service advantage. **The window to intervene is at contract start, not at renewal.**

Where the loss is concentrated

FY27 network budget with no action-tier tender visibility

Two different failures: the UK feed is healthy but nothing scores above Watch; the Israel source stopped returning data entirely.

SECTION 04 · THE METHOD

The SPA Study as the ROI Instrument

A price concession is easy to see and easy to refuse. The revenue it unlocks is invisible unless someone quantifies it. The SPA study closes that gap by forcing both halves onto one page before approval.

Worked example — Polish public fleet tender, 173 vehicles

A Polish public body tendered for 173 vehicles, requiring conversion from alloy to steel wheels with TPMS sensors, and a **minimum three-year Repair & Maintenance contract**. Our distributor asked for a discount on three part numbers so the base vehicle price could stay competitive. It was evaluated not as a discount request, but as an investment.

Situation before	No concession. Distributor uncompetitive on base vehicle price. Probable outcome: tender lost, 173 vehicles enter a competitor's parc, three-year R&M contract goes with them. Parts revenue to ISZE: **nil**.
Concession requested	35% on three part numbers — wheel disc, wheel cap, TPMS sensor — at 692 units each (four wheels across 173 vehicles).
Return 1 — incremental turnover	**€61,000** of parts turnover that does not exist without the concession.
Return 2 — the R&M annuity	173 vehicles × **€291.20** average annual parts spend per unit = **€50,400 per year**, contractually guaranteed for **three years** = **€151,000**.
Total quantified return on one concession	**≈ €211,000**

Figures from the internal SPA study of 29 July 2026 and its approval file. The €291.20 average annual parts spend per unit is an ISZE-derived figure for this market and is deliberately not interchangeable with benchmarks used in other markets. Pricing was approved on 21 August 2026; the tender award was still pending when this paper was written.

> **Why this format wins the argument.** It converts “the distributor wants 35% off” into “€61K of turnover we would otherwise not book, plus a €151K three-year annuity, for a one-off concession on 692 units.” The approver is no longer being asked to give something away. They are being asked to authorise a return.

SECTION 04 · CONTINUED

Making the Method Auditable

The Polish study proves the concept. It also exposes the gap that stops this becoming a system: once a concession is granted, nothing currently forces us to go back and check what it returned.

What the template must capture

Field	Why it is mandatory
Fleet size and vehicle model	The denominator for everything downstream
List price, agreed price, concession value in euro	The cost side, in money rather than a percentage
Incremental parts turnover unlocked	The immediate return
R&M attached? Term? Annual spend per unit?	The annuity — usually the larger half
Competitor if lost; evaluation weighting if known	Feeds the loss-reason record
Outcome and actual parts revenue at +12 months	**The field that turns a forecast into evidence**

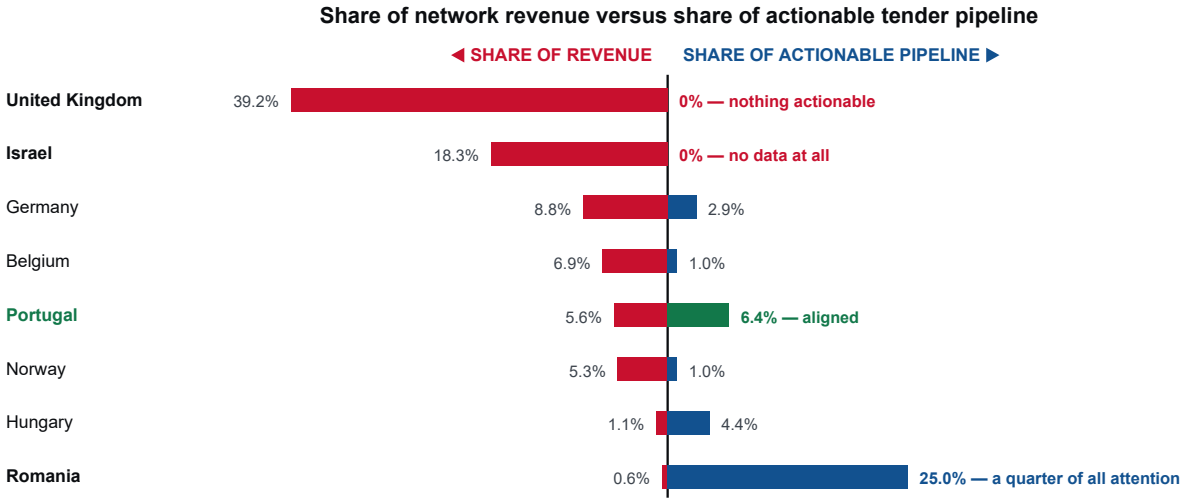

Honest limitation. In the Polish case the agreed prices and projected return were recorded, but not the list-price baseline in euro — so the concession *cost* cannot be stated with the same confidence as the return. The final row above does not yet exist for any concession we have granted. Until both are captured we can argue ROI persuasively but cannot prove it retrospectively. That is worth fixing before the method is scaled, not after.

What this unlocks once it runs for a year. Twelve months of completed studies gives us something no competitor courtesy or market report can: our own evidence on what a concession actually returns, by market, by fleet size, and by whether R&M was attached. That turns future pricing decisions from judgement into policy — and it is the foundation any serious negotiation with an R&M partner will require.

SECTION 05

Are We Watching Where the Money Is?

ISZE already runs a platform that scans European procurement portals weekly at no licence cost. It works. The problem is where it points. Set against the reviewed FY2027 network budget, coverage is close to *inversely* correlated with revenue.

Revenue share of mapped FY27 network budget (€33.2M). Pipeline share of 204 action-tier opportunities. Portugal, in green, is the only market where the two align.

Three findings, in order of size.
1. The UK and Israel together carry **57% of the network budget and return zero action-tier opportunities**. They fail differently: Israel is a dead source; the UK feed is healthy but nothing scores above Watch.
2. France, Spain and Italy are the largest unworked opportunity we have — 121 notices, **50 at action tier, 85 R&M-linked**, three of Europe's largest economies, and no working route.
3. Attention is inverted. Central and Eastern Europe absorbs **59% of all action-tier items for roughly 1.7% of mapped revenue**.

Coverage in numbers. 26 markets currently return notices. 21 return at least one actionable opportunity. **Five return notices but nothing actionable at all — including the United Kingdom**, our single largest market. A further four ISZE markets return nothing whatsoever because no source is configured for them.

SECTION 06

Sizing the Opportunity

A tender notice on its own is not a business case. What makes it one is the number of vehicles behind it, converted into the parts revenue those vehicles will generate. That conversion is how a fleet opportunity should be called out — not as a notice, but as a euro figure.

The method

Fleet units × average annual parts spend per unit = annual parts-revenue equivalent. Applying the ISZE-derived figure of **€291.20 per vehicle per year** gives every sized opportunity a directly comparable value, and makes prioritisation obvious.

Opportunity	Market	Units	Per year	Over 3 yrs
National postal operator — vans, 4-year lease with servicing	Romania	**83**	**€24,170**	**€72,509**
Municipal authority — panel vans	Germany	20	€5,824	€17,472
Municipal authority — panel vans (second lot)	Germany	20	€5,824	€17,472
Municipal authority — panel vans (third lot)	Germany	13	€3,786	€11,357
Regional mobility operator — bus fleet full service	Italy	9	€2,621	€7,862
Industrial operator — commercial and passenger vehicles	Germany	8	€2,330	€6,989
Road maintenance authority — trucks (four lots)	Poland	24	€6,989	€20,966
Public forestry authority — utility vehicles	Romania	5	€1,456	€4,368

210
fleet units currently visible in the pipeline

€61K
annual parts-revenue equivalent of those units

€183K
over a typical three-year contract term

And this is the floor, not the ceiling. Vehicle counts could be extracted from only **22 of 778 notices**. Fleet size is normally stated in the tender documents behind the notice rather than in the notice itself, and only 22% of notices carry any description text at all. The 210 units above are what happens to be visible — the true figure across 680 opportunities is materially larger and currently unmeasured. **Every sized opportunity we surface converts a notice into a number management can act on**, which is why closing this gap matters more than adding further markets.

Proposed prioritisation rule. Rank opportunities by parts-revenue equivalent, not by notice count or tender value. A 9-vehicle bus contract with full-service maintenance is worth more to us than a 40-vehicle purchase tender with no service attached — and the current scoring model cannot see that difference.

SECTION 07

Why R&M Is Hard to Launch at Our Size

This paper would be dishonest if it presented launching an R&M product as straightforward. It is not, and the reasons are structural rather than a matter of effort.

1. Scale makes partners hard to find

An R&M or extended-warranty product needs an underwriter or administrator willing to price Isuzu risk. Our European volumes are small, and a partner's appetite is a function of the parc they can spread that risk across. Through 2026 ISZE has run introductions with more than one candidate administrator on behalf of distributors, and continues to look for further options. That search is the right response, but it should be recognised for what it is: **we are asking partners to build a product for a parc that, at European scale, is modest.** The terms available to us will not match those a high-volume manufacturer commands, and any plan assuming otherwise will disappoint.

2. Distributors have already solved it themselves — in many different ways

Faced with no central product, distributors have not waited. Several markets have built their own arrangements: a local underwriter in one, a dealer-level service contract in another, a bespoke customer offer in a third. In the Polish tender, R&M cover was arranged through the distributor's own dealer network with a third-party provider. In the UK, a fleet deal reached us with the servicing contract already held by the dealer. Israel, Romania and others have arrived at their own local answers.

> **This is distributor initiative, not distributor failure.** It is the correct local response to a central vacuum. But it produces many incompatible offers, no shared commercial terms, no comparable data, and **no leverage when we approach a European partner** — because the parc that partner would cover is already fragmented across a dozen local arrangements.

3. Speed is decided elsewhere

Fleet tenders move on the buyer's timetable, not ours. The Polish case is instructive: the distributor needed pricing confirmation within days to give its dealers a calculation, and the supporting technical request reached our supply organisation as a first-of-its-kind enquiry. We depend structurally on approvals and technical support that sit outside Europe, on a cycle designed for planned business rather than for a tender with a published closing date.

The conclusion is not that this dependency should be removed — it is that Europe needs a pre-agreed envelope to move inside. A standing framework for fleet concessions, with defined thresholds and a defined escalation path, would let Europe respond at tender speed within limits already approved, rather than negotiating every case from a standing start. That is a request for agility within governance, not around it.

4. What a uniform way of working fixes

Today	With one standard method
Each fleet opportunity evaluated from scratch	One study format, comparable across every market
Concession approved on judgement	Concession approved against a quantified return
No record of what a concession returned	Actual revenue captured at twelve months
Many incompatible local R&M answers	Local delivery, common commercial terms
No European negotiating position with partners	A single aggregated parc to take to a partner

SECTION 08

Working With Vehicle Sales and IML

A tender is won or lost on the vehicle. The parts and service revenue follows that vehicle for the next eight to ten years. Those two facts sit in different organisations, and nothing currently connects them. What follows is deliberately minimal — anything requiring reorganisation will not happen.

With Vehicle Sales

Moment	Vehicle Sales does	ISZE does
Tender appears	Receives the qualified lead for its market	Runs the platform, qualifies, routes to a named owner
Bid construction	Owns the vehicle offer and the customer relationship	Supplies the SPA study and parts pricing within a pre-agreed envelope
Award — won	**Notifies ISZE: fleet size, model, delivery date, customer**	**Triggers aftersales onboarding; registers the fleet for renewal tracking**
Award — lost	Requests the procurement debrief, an EU legal right	Records the loss reason; feeds it into pricing policy

> **The highest-value line in that table is the third.** Today, when a fleet tender is won, there is no defined moment at which the aftersales organisation learns the fleet exists. Creating that handover costs nothing, and it is the difference between a vehicle sale and an eight-year parts relationship.

With IML — three asks, in increasing order of ambition

- **A standing fleet-concession envelope.** Defined thresholds and volume bands for public fleet tenders, pre-approved, with a clear escalation path above them. Europe then responds at tender speed inside limits already set.
- **Recognition of the SPA study as the standard approval artefact.** One format for every fleet concession, so decisions are comparable and outcomes auditable — in Europe and in Japan alike.
- **A normal route for tender-driven technical and supply enquiries.** Fleet tenders will keep generating part-number and availability questions. They need a standing channel rather than an exceptional one.

None of the three requires new budget, new headcount, or a change to any reporting line. All three reduce the number of decisions that must travel — which is the actual constraint.

Sharing the output beyond ISZE

Tender intelligence is worth little if it stops with us. The qualified list should reach whoever holds the commercial relationship in each market. In markets where an independent entity holds the relationship, sharing the output costs nothing and is the fastest available test of whether the pipeline converts.

SECTION 09

What the Competition Already Does

Competitors in the light commercial vehicle and pickup segment have made fleet intelligence and proactive aftermarket engagement structural rather than tactical.

Ford Pro — the benchmark

A dedicated commercial vehicle division created in 2021, combining vehicles, service, financing and software for business and public-sector fleets.

- **€66 billion revenue, €6.8 billion EBIT in 2024** — a 10.3% margin.
- **17% of that EBIT comes from aftermarket, software and services**, against a target of 20% from software and services by 2026.
- Its intelligence platform analyses a billion vehicle data points daily, triggering maintenance and parts activity proactively.
- 2,400 mobile service vehicles in Europe; repair orders grew 70% in 2024.

Sources: Ford Q3 2024 earnings and Ford Pro European strategy announcement. Figures are from 2024 and have not been re-verified against more recent filings.

Why tender win rate is the wrong measure

A natural instinct is to benchmark ourselves on the percentage of tenders won. That measures the wrong thing. **The comparison below is an illustration of the underlying economics — not Ford data, and neither company is real.** It shows why win rate and commercial value move in opposite directions.

Illustrative comparison	Distributor A	Distributor B
Tender win rate	40%	25%
Genuine parts capture after the sale	Near zero — no follow-up structure	High — terms agreed at delivery
Revenue per vehicle over eight years	Vehicle margin only, one-off	Vehicle margin plus recurring parts revenue
Outcome	Looks better on a scorecard	Generates several times the commercial value

The point of the illustration. Ford Pro's 17% of EBIT from aftermarket tells us they operate as Distributor B, systematically. That — not their win rate — is the benchmark worth chasing: the depth of the commercial relationship per vehicle placed.

The rest of the segment

Manufacturer	Approach	Our gap
VW Commercial Vehicles	Factory telematics; €127M subscription revenue in 2024	No telematics connectivity in our model
Toyota	Merged vehicle and parts supply chains into one division	We operate as a pass-through
Mercedes-Benz Vans	Dedicated public fleet teams in DE, FR and the UK	We rely on distributor initiative
Stellantis	Explicitly following the Ford Pro model	No equivalent programme

The uncomfortable part. None of these competitors is winning because they discovered something we cannot. They are winning because someone owns the motion. The tender is the entry point; the aftermarket is the business.

SECTION 10

This Year's Target, and the One After It

There are two different questions in front of us, and conflating them has made the second look easier than it is.

The near term is on track

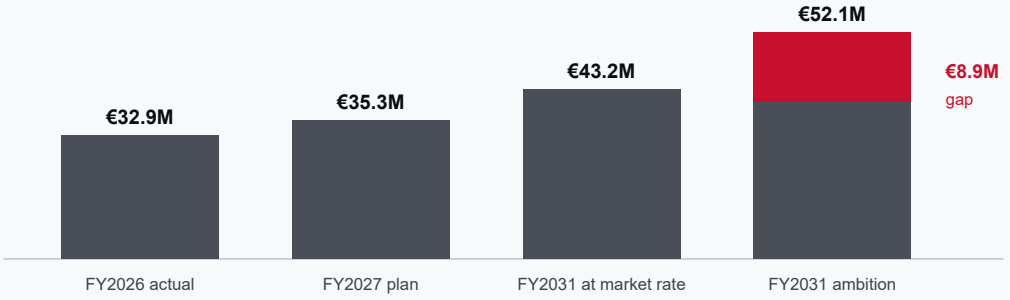

FY2026 closed at **€32.94M** of network revenue against a plan of €32.3M — slightly ahead. The FY2027 plan is **€35.28M**. The instruments driving that are working: SPAs, the periodic maintenance programme, and genuine parts share initiatives. **It is reasonable to expect this year's target to be met with the mechanisms we already run.**

FY2026 actual and FY2027 plan from the reviewed FY2027 business plan waterfall of 30 June 2026.

The long-range target is a different problem

The long-range ambition asks for roughly **€52M by FY2031** — about 10% compound annual growth against a European aftermarket growing at approximately 6.35%. Around **€8.9M of that cannot come from market growth.** It has to come from commercial mechanisms that do not exist today.

FY2031 ambition versus what market growth alone delivers

The red block is the portion no amount of pricing or campaign activity on the existing parc will deliver. It requires a larger served parc.

This is the strategic point of the paper. Price increases, SPAs and parts-share campaigns are enough to deliver the near-term plan. They are not enough to deliver the long-range target, because they optimise revenue from a parc we already serve. Closing a gap of that size requires **growing the served parc itself** — which is precisely what winning fleet tenders and their attached R&M contracts does. Each R&M win converts vehicles already on the road into captured parts revenue, three to five years at a time.

Long-range figures are carried from the January 2026 study. A revised FY2028–FY2031 trajectory has not been issued, so these should be treated as directional pending confirmation.

SECTION 11

What We Are Asking For

Nothing in the immediate block requires budget or headcount. The decisions require agreement, not investment.

Decisions requested from management

#	Decision	Cost
1	**Adopt the SPA study as the standard evaluation and approval artefact** for every fleet opportunity in Europe, including the outcome field that lets us prove the return afterwards	None
2	**Agree a standing fleet-concession envelope** with defined thresholds and an escalation path, so Europe can respond within tender deadlines	None
3	**Establish the won-fleet handover** from Vehicle Sales to aftersales as a defined step	None
4	**Name one owner** for the weekly tender review and lead routing	~4 hrs/week

Immediate — 0 to 4 weeks, within the current resource base

- Restore the Israel source — 18% of network revenue currently has no tender visibility at all.
- Complete the free registrations covering the Norwegian and Finnish national portals.
- Assign owners to the two top-tier opportunities closing in mid-September, and the two closing within 48 hours.
- Share the qualified France, Spain and Italy list with the party holding those relationships.
- Record the Polish tender outcome against its SPA study — the first entry in an evidence base we do not yet have.

Short term — 1 to 3 months

- Establish why the UK returns no actionable opportunities from 125 notices: scoring defect, or genuine fit gap. Both answers are useful; we currently know neither.
- Restore below-threshold visibility in Belgium and Germany — €5.2M of budget currently seen only above EU threshold.
- Begin requesting procurement debriefs on lost tenders and recording loss reasons.
- Add parts-revenue-equivalent sizing to every qualified opportunity, so leads reach distributors as a euro figure rather than a notice.

Medium term — 3 to 12 months

- Decide the Central and Eastern Europe question deliberately: 59% of action-tier attention for 1.7% of revenue is either a growth bet worth making explicitly, or a misallocation.
- Consolidate fragmented local R&M arrangements into common commercial terms with local delivery — the only route to a European negotiating position with a partner.
- Pursue national framework qualification, the highest-leverage way to remove the price objection entirely.

The proposition in one line. We already own the intelligence platform, and we have already proven the evaluation method on a live deal worth €211,000. What is missing is the decision to use both as standard. That decision costs nothing, and it is the difference between fleet opportunities reaching us by accident and reaching us by design.

SECTION 12 · APPENDIX

Platform Status and Limitations

A platform that scans European procurement portals weekly, classifies each notice against our target categories, scores it on strategic fit, win feasibility and commercial value, and produces a distributor-ready lead brief. No licence cost, no vendor, roughly four hours of staff time per week. The most recent run processed **778 notices into 680 scored opportunities across 26 markets**.

Source	Coverage	Status
EU Official Journal	27 member states, above threshold	Live — 605 notices
United Kingdom, two portals	Above and below threshold	Live — 143 notices
Netherlands national	Dutch public procurement	Live — 25 notices
Israel	Israeli public procurement	**Dead** — endpoint no longer serves data
Belgium national	Below-threshold Belgian contracts	**Dead** — endpoint no longer serves data
Norway national	Norwegian public procurement	**Off** — free registration never completed
Finland national	Finnish public procurement	**Off** — free registration never completed
Germany national	Below-threshold German contracts	**Not implemented**

Why nobody noticed. Both dead sources return a valid-looking response containing no data, so the weekly run reports them as “0 results” rather than as failures. The system cannot currently distinguish *no tenders matched this week* from *this source has been dead for months*. A health check that fails loudly is the first technical fix — ahead of adding any new market.

Known data limitations

Limitation	Scale	Consequence
Notices with no deadline captured	76%	Most of the pipeline cannot be triaged by urgency
Notices with no fleet size extractable	97%	Opportunities cannot be sized in revenue terms without manual reading
Notices with no contract value	90%	Commercial scoring relies on proxies
Expired opportunities still shown as actionable	4 live	Between 18 and 39 days past their closing date

All four have identified fixes and none require new tooling. A technical specification accompanies this paper.
