AFTERSALES COMMERCIALISATION · NOT VEHICLE MANUFACTURING

The quotable gap is clutch and brake — not the filter worked example

We billed **€30.8M against a €60.2M CY2025 target-spend ceiling** (51.1%). **37% of that ceiling is a flat €250/UIO placeholder** — cover reads 29–44% under defensible alternatives. The largest quotable component gaps are **clutch disc €3.14M, brake pad €2.78M, brake shoe €2.47M** (46% of an €18.22M basket gap). Independent unit volume is **UNKNOWN**. Ready levers already sit on the table.

How to read this paper

Every headline here is either a signed CY2025 fact, a labelled YTD, or an explicit UNKNOWN — never a blended Israel, never a fake independent-garage share, never an external GP rate dressed as a verify KPI.

This is an aftersales **commercialisation** paper for the European parts hub. It is not a Japan P&L, not a vehicle-sales review, and not a new 0–100 score (that scoring family is closed).

What the numbers are

Parts billed vs target — euros billed versus a max-spend ceiling (target spend per truck × parc). **Ceiling is not a forecast**, and about 37% of it is a flat €250/UIO placeholder — page 3 prints the sensitivity. Green spend-per-truck is ≥ €150. Spend per truck and workshop cover are two different questions.

PMS total — units sold in the service basket versus expected demand. Headline is total (genuine + BVP). Genuine is a quality lens only.

Component gap ranking — from the opportunity matrix. That ranking is the euro lead; the UK-truck IML oil-filter story is a method illustration.

Gross margin on page 8 is Eucon scraped-set evidence (or UNKNOWN). External industry GP composites stay labelled external.

CY2025 is complete. **2026 YTD** is 1 January–2026-06-30. Partial years are never annualised.

What the numbers are not

Two UK-truck covers exist. Method illustration = IML service schedule (oil-filter 35.1%, UIO 22,389, gap €2.04M). Distributor ranking uses one shared denominator (bucketed parc 23,068). They answer different questions. IML filters assume 1.25 services/yr; the network lane uses 0.5 — that alone is a 2.5× denominator difference.

Israel is two distributors — UTI and UMI — always two rows. The Israel dealer-score round is UMI only.

IUK is not ITUK. Ireland is not IUK. Independent-garage **unit volume is UNKNOWN**. `100% − PMS` is residual, not IAM alone. Telematics and subscriptions have **no workspace data** — sized as a modelled option or named as a data gap, never merged into an internal KPI.

UNKNOWN Independent-garage unit share · unsigned list-to-pocket euros · air-filter interval pending IML confirmation · UK-truck brake wear 0.4 vs 0.8 · ISZE realised CO-PA margin by category · connected-vehicle / VIN feed.

Reference dealer sell-out is the ISZE list price times 1.40 to the dealer times 1.275 to the customer price we use as the dealer sell-out we compare to shops (= ×1.785). Price index = shop or aftermarket quote ÷ that reference. We say OEM peer retail / dealer sell-out / reference dealer sell-out — never a slang label for the counter.

● Green ≥ €150/UIO or a signed fact ● Amber — incomplete or watch
● Red — material gap on a signed definition ● Grey — UNKNOWN

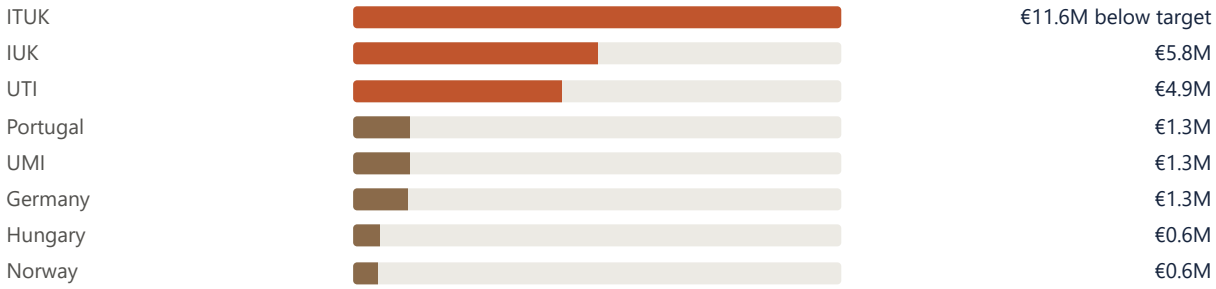

Parts billed versus target spend — and the placeholder in the ceiling

CY2025 the hub billed €30.76M against a €60.22M max-spend ceiling (51.1%). About 37% of that ceiling is a flat €250/UIO placeholder — the same billed book reads 29–44% cover under defensible alternatives.

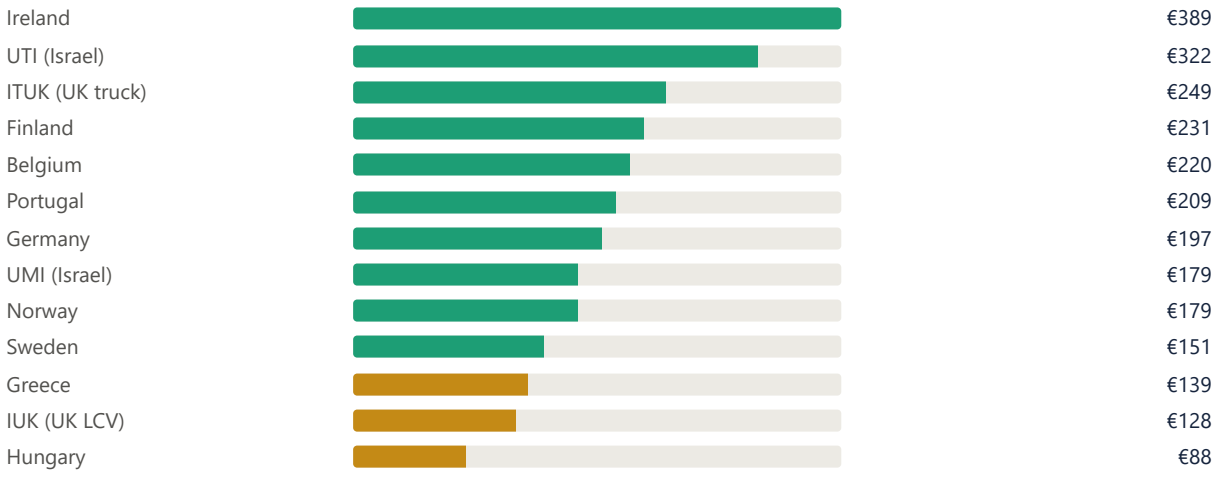

Spend per truck on the traffic light is green in 15 of 18 markets with parc. That is not the same as filling the ceiling: ITUK is green at €249/truck and still sits at 32.4% of its target spend — the largest euro pool below the ceiling.

37% of the €60.22M ceiling is a flat €250/UIO placeholder (8 near-flat markets). Sensitivity if those markets used other signed targets: non-flat median €364 → cover **43.6%**; Portugal €423 → **40.6%**; ITUK €745 → **29.4%**. The €29M residual inherits the assumption. Ceiling = max-spend, not a forecast.

Euros still below the target-spend ceiling concentrate in three distributors · CY2025

Spend per truck is green across most of the parc; Hungary, UK LCV and Greece are amber · CY2025

UMI warranty distorts the green light. Headline spend per truck is €179 (green). Strip warranty parts and it is €82 (red). This paper recommends the room keep both figures and prefer the ex-warranty number when comparing capture quality across distributors.

UNKNOWN Ukraine, Armenia, Kazakhstan and Palestine bill parts but have no GPS parc in this league — about €1.62M CY2025 omitted, not zero. MIDI is not an ISZE customer row here. 2026 YTD spend per truck is half a year against a full-year parc — it is not a traffic light.

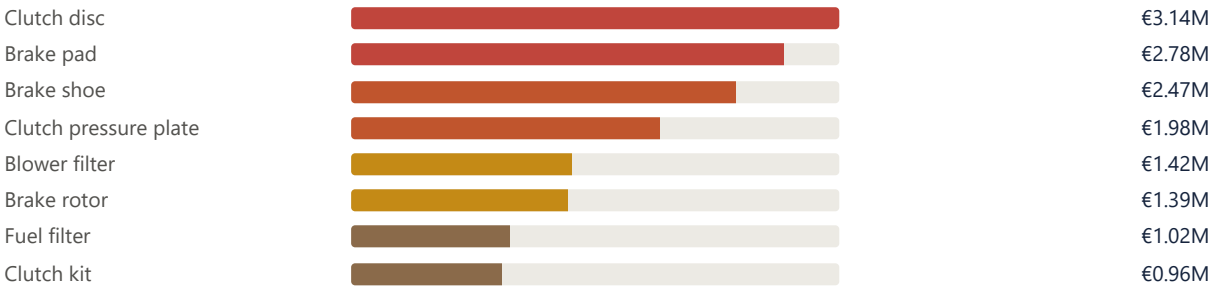

2026 year-to-date parts billed in the 18 GPS markets: **€8.76M** through 2026-06-30. That is a stub, not a run-rate.

Component gaps — clutch and brake lead; oil filter is the method story

The quotable network basket gap is €18.22M. Clutch disc, brake pad and brake shoe alone are €8.39M (46%). The UK-truck IML oil-filter 35.1% story remains the method illustration — not the euro lead.

Rank by euro at stake from the opportunity matrix (CY2025). Oil filter on that matrix is €0.32M (1.8%). Gap types (model year 2026 file): substitution €11.40M · under-service €9.56M · catalogue gap €2.18M — opposite commercial responses.

Largest component gaps: clutch disc €3.14M, brake pad €2.78M, brake shoe €2.47M · CY2025

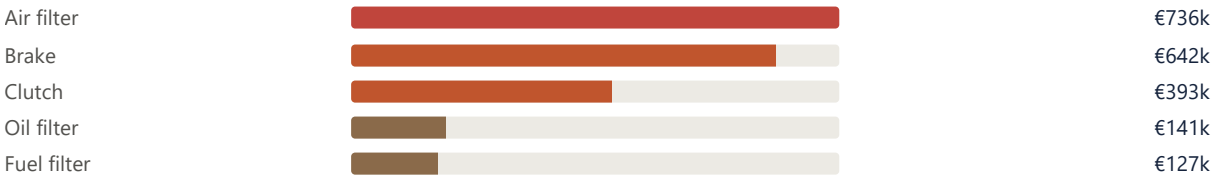

Gap type (2026 model vintage): substitution is a price fight; under-service is a workshop-demand fight

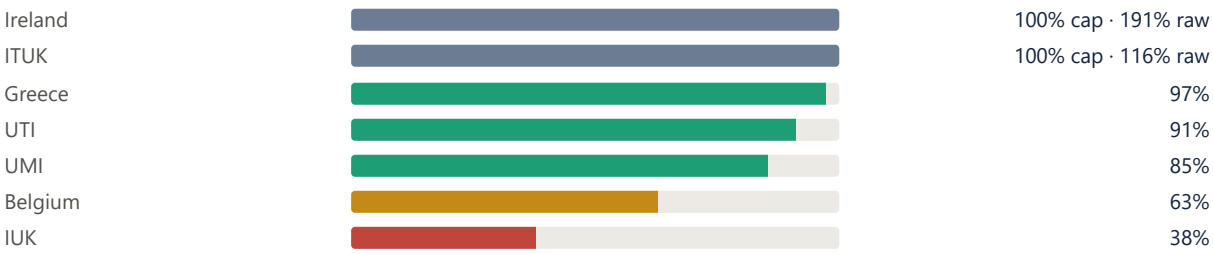

Method illustration — not the opportunity lead. IML UK-truck service schedule: filters 1.25/yr (network lane uses 0.5 — a 2.5× denominator difference), clutch and brake 0.5, parc 22,389. Oil-filter cover 35.1%, five-category gap €2.04M (air €736k, brake €642k, clutch €393k). Keep this as the worked example of schedule math — do not let it own the room's priority list.

IML UK-truck five-category gap euros (method illustration) · CY2025

Network-comparable ranking uses a different denominator (bucketed parc 23,068 for the UK truck row). On that ranking UK truck oil-filter total is above 100% uncapped — valid when actuals include sales beyond the truck-only proxy. It is **not** the 35.1% IML figure. Ireland's uncapped 191% is why this paper does not plot a "best market" series.

Network-comparable oil-filter total (capped display) — for ranking only · CY2025

Germany		15%

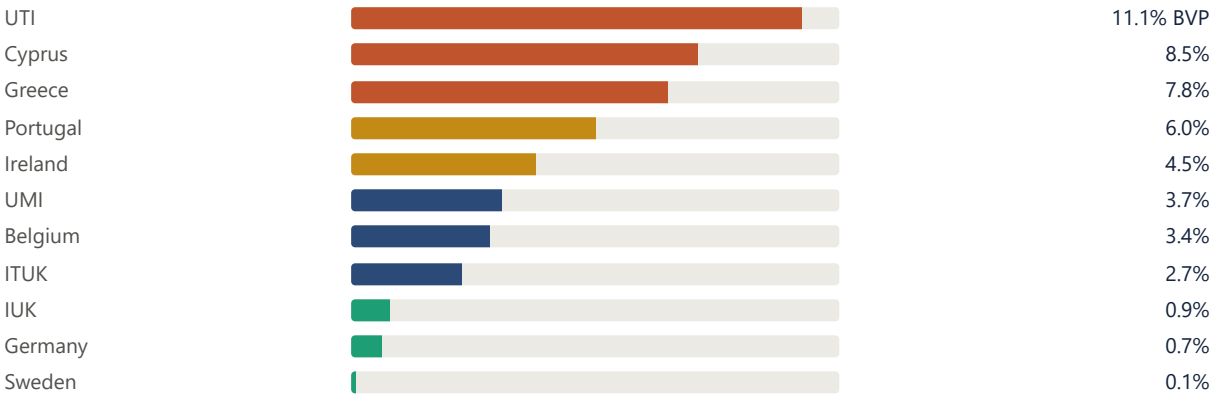

UNKNOWN Jobs not sold through the dealer are not independent-garage volume. Air-filter interval on the network-comparable view is a provisional 0.5 factor until IML confirms. Capture-recovery gap types are a 2026 model year file — labelled as such.

Mix — quality of what was sold, not capture

Of the €30.76M billed in CY2025, 96.5% is genuine and 3.5% is BVP (€1.06M) — mix sits two orders of magnitude below the euro still outside the target-spend ceiling.

BVP is a down-trade inside the tent. It has **no capture rate**. Treating BVP mix as "BVP capture" would invent a KPI. The commercial question is whether mix is eating margin on a book we already sell — not whether we "captured BVP."

BVP is a thin slice of captured sales except at UTI, Cyprus, Greece and Portugal · CY2025

Distributor mix (captured book)

ITUK 97.3% genuine · UTI 88.9% genuine (11.1% BVP) · UMI 96.3% genuine · IUK 99.1% genuine. UTI and UMI are two Israel distributors — never averaged.

Shell 5500* is lubricant, not bumper iron

Prefix 5500* on the UMI book is Shell Rimula, excluded from "pure" GPS sales and stored separately. Fiscal 2025 Shell on UMI: **€520k**. Do not bury it in unclassified hardware. The older "€442k lubricants project" line is not used here — it was never tied to this extract.

UNKNOWN Gross-profit given up to down-trade is a modelled extra, not a GPS headline. This page quotes mix of billed euros, which is signed. Do not add mix "loss" to the €29.5M below-target pool — different questions.

Distributor league — three separate columns

Read three columns as three questions: spend per truck, network-comparable oil-filter cover, and genuine mix — never one blended score. Keep UTI, UMI, ITUK and IUK as four different rows.

DISTRIBUTOR	€ / TRUCK	LIGHT	BILLED VS TARGET %	OIL-FILTER TOTAL*	GENUINE MIX
Ireland	389	Green	124.2%	100% cap	95.5%
UTI (Israel)	322	Green	40.3%	91%	88.9%
ITUK (UK truck)	249	Green	32.4%	100% cap	97.3%
Belgium	220	Green	86.0%	63%	96.6%
Portugal	209	Green	56.0%	52%	94.0%
Germany	197	Green	66.6%	15%	99.3%
UMI (Israel)	179	Green†	71.6%	85%	96.3%
Norway	179	Green	71.5%	48%	98.2%
Sweden	151	Green	60.6%	49%	99.9%
Greece	139	Amber	54.6%	97%	92.2%
IUK (UK LCV)	128	Amber	51.3%	38%	99.1%
Hungary	88	Amber	35.4%	45%	96.6%

*Oil-filter total is the **network-comparable** rate (capped at 100% for display). ITUK's 35.1% IML figure is the method illustration on page 4 — do not substitute it into this column. †UMI ex-warranty spend per truck is €82 — **prefer that number when comparing capture quality**; keep €179 when describing billed book including warranty.

> Ireland's billed-vs-target above 100% means parts billed exceeded the max-spend ceiling — over-target, not a data bug. Germany's 15% oil-filter total on the shared denominator is the weak workshop row in this league, despite a green spend-per-truck.

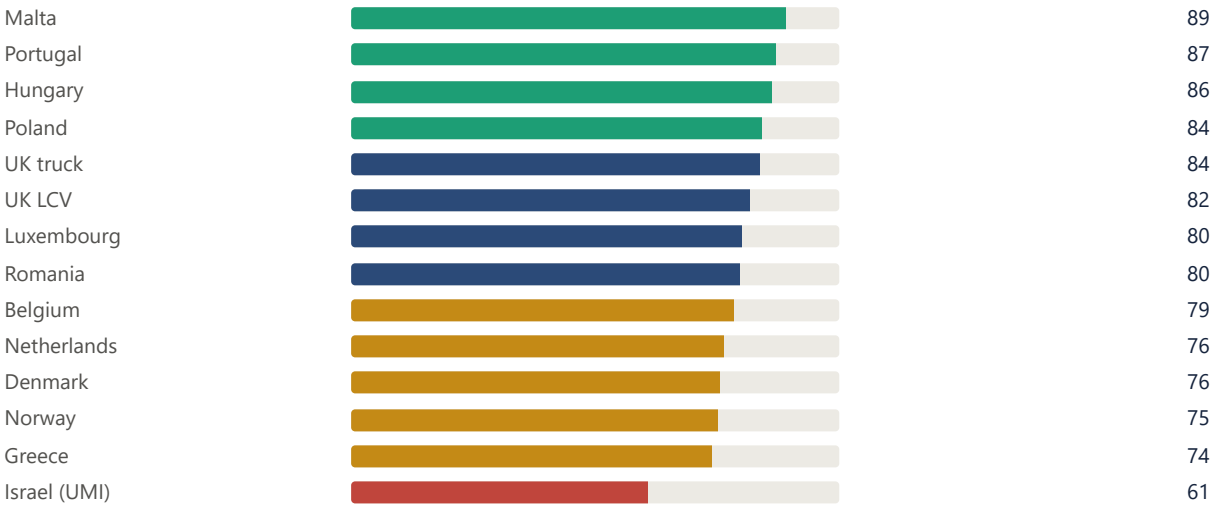

UNKNOWN No "Israel" average. No IUK+ITUK blend. CIS rows without parc stay off this table.

Dealer network scores versus country average

Israel's dealer round is the UMI network only (mean 60.9) — UTI did not sit that round — and four MIDI countries use a different points scale, so they are not plotted as percentages.

Dealer score versus **that country's** average. Labels in English. This page is a league of country means on the 0–100 packs, not a map (maps belong in the country packs, and only when pins are not clustered on a country centroid).

UMI's Israel dealer mean sits well below Portugal, Hungary and both UK networks · IDS 2026

Israel (UMI) — top of that network

Country mean **60.9** (29 dealers). Highest: Kfir Yaud 69.6 · Eden Garage Rishon 68.6 · Tel Hanan Haifa 68.6 · UMI Petach Tikva 67.5. Every one of those still sits below Portugal's mean (86.9) and UK truck mean (83.8).

France, Italy, Spain, Switzerland — different scale

Those packs store raw points in the thousands, not a 0–100 percentage. Plotting them on this chart would fake a 5,000% score. They participated; they are not in this bar. Use the country pack for those rooms.

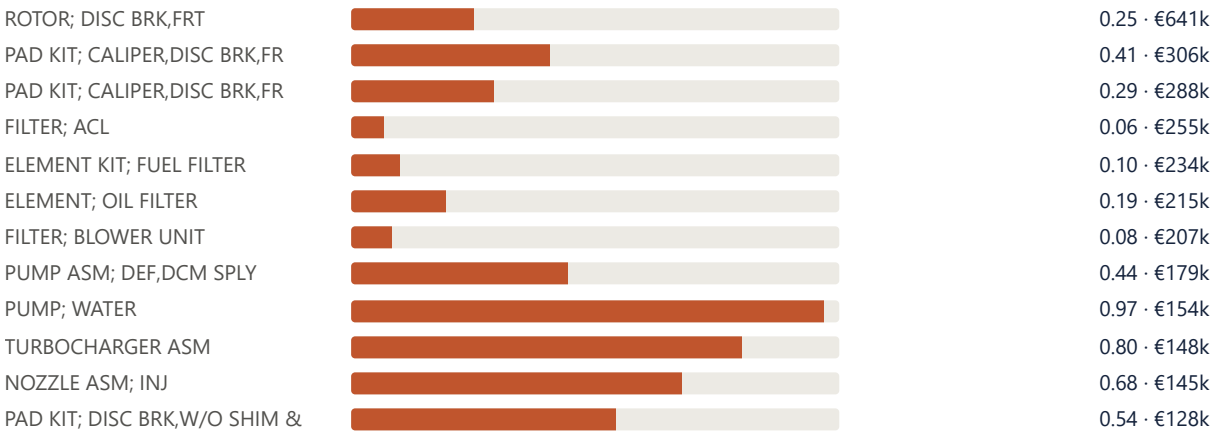

UNKNOWN UTI dealer scores for this IDS round — they did not participate. Do not back-fill from UMI. Weak-sector radar overlays are diagnostic clutter and are not shown.

Aftermarket price, Eucon margin, and no-list part numbers

On the 130 parts with an aftermarket scrape and a CY2025 billed line, median price index is 0.42. Eucon adds €2.21M GP at risk on 44 PNs. NO_LIST on the pricing findings is about €4.96M across 251 part numbers.

Reference dealer sell-out is the ISZE list price times 1.40 to the dealer times 1.275 to the customer price we use as the dealer sell-out we compare to shops (= ×1.785). Price index = shop or aftermarket quote ÷ that reference. Scrapes are **price**, not volume. About 28% of scrape points sit on an undated Autodoc file — vintage stays honest.

Top 12 parts by CY2025 billed € on the scraped set — price index (shop ÷ reference). Below 1 = shop cheaper than our reference

PART	DESCRIPTION	PRICE INDEX	BILLED €	SCRAPE VINTAGE

Gross margin layer (Eucon UK 2023 set)

€2.21M GP at risk across 44 contested part numbers. Brake rotor gross margin **40.8%**; brake pad kit **32.2%**. This is scraped-set evidence for prioritisation — not ISZE realised CO-PA. Prefer margin over billed euro when ranking defence lines.

NO_LIST — cheapest euro on the table

Pricing findings: about **€4.96M** across **251** part numbers with no usable list price (on-list-no-price plus absent-from-list). That is a data/governance fix inside the opportunity set — not a demand fight.

What we can say on price

130 unique part numbers · **112** with at least one shop quote below reference · median price index **0.42**. That is a price fact — not an aftermarket share. Set is euro-relevant (~22% of the CY2025 parts book) but not PN-representative (0.77% of billed PNs).

UNKNOWN Independent-garage **unit volume**. ISZE realised gross margin by category (CO-PA) is not in the workspace — Eucon is the interim layer. Dealer sell-out longs exist only for five distributors (54.4% of GPS billed euro).

Full scatter: sibling launcher `OPEN_ISZE_IAM_Price_vs_Billed_PN.cmd`. A pocket gap between list and net billed **exists** as an internal question; the euro is **not signed** for external quote.

Demand, replenishment, forecast honesty

Sell-out files cover 54.4% of GPS billed euro (five distributors). Replenishment exceptions are therefore a half-the-book fact. Forecast median WAPE 49.4% on 548 of 636 series is normal for intermittent spares — a surface, not a signed live forecast.

Sell-out files exist for ITUK, IUK, Ireland, UTI and Greece = **54.4% of GPS billed euro** (€16.74M of €30.76M). Germany + Belgium + Portugal would add €6.36M and lift visibility to **75.1%**. Everywhere else, "no exception" would mean "no file," not a clean pipeline.

1,595 CY2025 exception rows sit on five distributors only — 54.4% of billed euro, not the whole network

Forecast surface (not go-live)

548 of 636 series back-tested. Median WAPE **49.4%** — defensible for intermittent spare parts (practice often cites 40–70%). Bias % and Forecast Value Added vs the naive baseline are not yet printed. Gate G1 is **unsigned**. Override policy is also unsigned.

UNKNOWN Realised euros past the billing horizon. Growth-factor 1.24 / 1.25 still unsigned. Book B (the price list we might change) cannot become a price move until alloc ambition is named (+4% / +5% / launch-only) — about €510k–€638k/yr on the L12M basis.

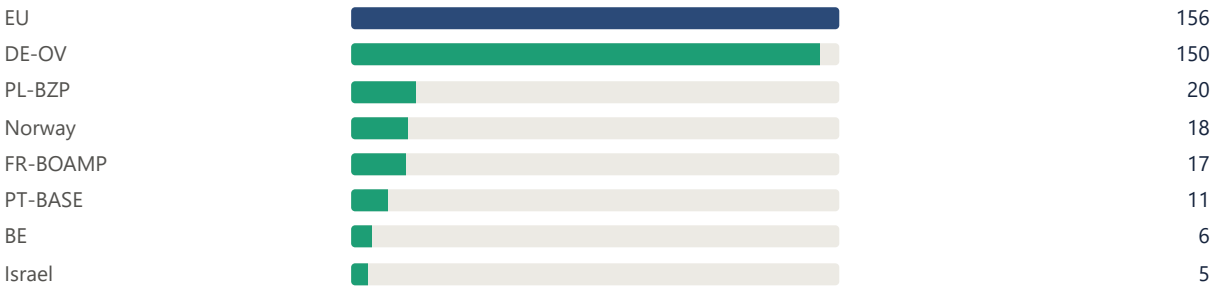

Do not read 2026 year-to-date as a decline versus CY2025. Capture-trend alerts that treated a stub year as a full year were a known false cliff; complete-year declining pairs still on the books: Ireland clutch kit, ITUK brake rotor, Romania brake rotor, Romania clutch kit, UTI clutch kit (five, not thirty-three).

Public tenders — live feed, footprint play not parts revenue

Live feed as of 2026-09-15 04:20:49: 376 opportunities, 28 due in 14 days, 374 of 402 rows missing value, 14 national sources reporting. After-sales addressable on the feed is tiny versus replenishment leakage.

Notice count is not fleet potential and not award euro. Nordics national APIs are done — the remaining gap is portals, not credentials. Of 376 opportunities, only **11** carry a GPS-addressable euro (about **€55,786/yr**). That is roughly 1/48th of the visible replenishment leakage (€2.68M). **Tenders are a relationship and footprint play, not a parts-revenue play.**

Live source mix on the tender feed · as of 2026-09-15 04:20:49

Live cut

376 opportunities · **28** due in 14 days · **374** of **402** missing extractable value · **14** sources reporting · aftersales-tagged **45**.

UNKNOWN Award euros. Below-threshold volume in dark countries. Israel domestic IEC from a non-IL address. Do not invent a tender spend pool from notice counts.

Credentials for the Nordic national APIs are done. Wire the next national portal (Spain fetcher is code-ready behind a firewall) — do not re-open a key setup sheet.

Warranty, telematics, integrity — first-class UNKNOWNs

Warranty parts are €4.72M (14.6% of the CY2025 billed book); claim expense fell 25% year-on-year. Telematics has no workspace data — sized only as a modelled option. Account-health thresholds are not calibrated.

HOLE	WHAT WE KNOW	WHAT WE DO NOT
Warranty flow	€4.72M parts billed = 14.6% of book; claim expense €4.22M → €3.18M (−25%); UMI warranty is 54% of UMI's book	Whether the claim decline is quality or tighter authorisation — and whether dealers then push work into customer-pay at lower capture
Telematics / subscriptions	No VIN / connected-vehicle feed in the workspace. External sizing only: at 5% attach × €20/unit/month on the 163k GPS parc ≈ €1.96M/yr gross (illustrative)	OEM data ownership; real attach; ISZE product position
Independent volume	Price baskets exist on the scraped PN set (page 8)	Unit share. Residual of PMS is not IAM.
List-to-pocket	A pocket gap exists as an internal question	A signed euro for this room
Sell-out coverage	Five DBs = 54.4% of GPS billed euro; DE+BE+PT would reach 75.1%	Every other GPS market — source gap, not 0%
Account health	10 RED / 6 AMBER of 17 on 2026-08 snapshot · **thresholds_calibrated: false**	A signed call list (Early Warning remains the sales call list)
Defection queue	25 alerts across 14 distributors; 9 carry zero trailing-12-month revenue	Recoverable base on the zero-revenue rows
Air / brake factors	Network air 0.5 provisional; UK-truck brake 0.4 applied	IML-locked ratios
Forecast G1	WAPE 49.4% on 548 of 636 series	Go-live signature, bias %, FVA vs naive
CIS / MIDI	Bill or warranty may exist (~€1.62M CIS without parc)	GPS league rows (by design)

Credit and return lines on positive value were excluded from GPS and PMS as a documented judgment — not an ERP-confirmed netting rule. If the next extract with sales-type codes reverses the call, GPS and capture move.

UNKNOWN This panel is the product. Smoothing a hole into a chart is how a careful paper becomes an unreliable one. External telematics figures must never merge into an internal verify KPI.

Strengths and weaknesses — ISZE aftersales

Strengths are a green book, genuine-heavy mix, and ready commercial packs; weaknesses are an €18.22M component gap led by clutch/brake, a ceiling that is 37% placeholder, and unsigned pocket/forecast/alloc gates.

Entity = the European parts hub. Internal evidence only on this page. Every cell has a claim, a euro or volume, an UNKNOWN, and the fact that would rewrite it.

Strengths

The parts book is verified and current through 30 June 2026.

116 pass / 0 fail · 514,037 lines · GPS-facing parts base €112.09M (2023 through YTD).

UNKNOWN Apr–Jun 2026 sales-type codes missing; credit/return exclusion for that quarter is sign-based only.

Would change the cell: Next extract with sales-type codes confirming or reversing the credit rule.

What we sell is still overwhelmingly genuine.

96.5% genuine / 3.5% BVP of €30.76M captured CY2025 (€1.06M BVP). ITUK 97.3% genuine.

UNKNOWN Mix is not capture. BVP has no capture rate.

Would change the cell: A large distributor where BVP becomes the sold book.

A price-revision pack and a no-list register already exist.

Book B (the price list we might change): 6,326 PNs · €12.76M L12M · +4% ≈ €510k/yr · +5% ≈ €638k/yr. NO_LIST ≈ €4.96M / 251 PNs.

UNKNOWN Alloc ambition still unsigned (no_alloc_run). Realised CO-PA margin by category still missing.

Would change the cell: One signed alloc ambition and a named owner for the 251 no-list PNs.

Weaknesses

Component gaps concentrate in clutch and brake, not filters.

€18.22M matrix gap · clutch disc €3.14M · brake pad €2.78M · brake shoe €2.47M (46%). Oil filter €0.32M.

UNKNOWN Independent-garage unit volume. Structural fitment vs commercial share on 92–95% unfilled lines.

Would change the cell: A brake/clutch pilot with pre-registered success criteria — or a fitment audit that reclassifies the gap.

The headline cover inherits a flat-ceiling placeholder.

51.1% of €60.22M · 37% of ceiling at flat €250/UIO · sensitivity 29.4–43.6%.

UNKNOWN Per-market age-spend curves.

Would change the cell: Age-band targets replacing the flat €250 assumption.

Realization, forecast G1, and account-health thresholds are unsigned.

Pocket euro: not quoted. WAPE 49.4% on 548 of 636. Account health 10 RED / 6 AMBER with thresholds_calibrated: false.

UNKNOWN Bias % / FVA vs naive; recoverable base on zero-revenue defection rows.

Would change the cell: Written list-to-pocket sign-off, G1 yes/no, and calibrated thresholds.

Opportunities and threats — still sourced or UNKNOWN

Named euro opportunities are the matrix clutch/brake gaps, Book B alloc ambition, no-list PNs, and DE/BE/PT sell-out; the named threat is independent price without independent volume — plus a telematics option with no VIN feed.

Opportunities

Sign Book B alloc ambition — highest return per unit of effort already built.

6,326 PNs · €12.76M L12M. +4% ≈ €510k/yr · +5% ≈ €638k/yr on L12M. Pack built 2026-08-19; no_alloc_run today.

UNKNOWN Which ambition (+4% / +5% / launch-only). Cross-check vs price-index < 0.5 lines before publishing.

Would change the cell: One signed alloc ambition.

Close no-list and the three missing sell-out files.

NO_LIST ≈ €4.96M / 251 PNs. DE+BE+PT sell-out would lift visibility 54.4% → 75.1% of billed euro.

UNKNOWN Owner for the 251 PNs. DB IT cooperation for the three files.

Would change the cell: Named owners and three verified sell-out longs.

Brake and clutch capture is the pilot, not oil filter.

€8.39M in the top three categories. Eucon rotor GM 40.8% / pad kit 32.2% for margin prioritisation.

UNKNOWN Per-dealer variance for a formal power calculation — do not open a pilot on a guess sample size.

Would change the cell: Pre-registered ≥8 pt capture lift on brake pad (and clutch) with price-index guardrails.

Telematics is a modelled option — or a written no.

Illustrative: 5% attach × €20/unit/month on 163k GPS parc ≈ €1.96M/yr gross (external sizing). Comparable to base-case 36-month component SOM.

UNKNOWN VIN / connected-vehicle feed and OEM data ownership — data we do not have.

Would change the cell: A board decision either to build or to state ISZE will not.

Threats

Independent price at the counter undercuts reference dealer sell-out on a thin basket.

130 PN on the scraped ∩ billed set · 112 with a shop quote below reference. Coverage too thin to be share.

UNKNOWN Independent unit volume. Vintage labels must stay honest on every shared price file.

Would change the cell: One family of independent unit counts, or honest vintage labels on every shared price file.

Calling residual PMS "independent share" would steer the room at the wrong enemy.

Target-spend residual ~€29M · matrix gap €18.22M · IML UK-truck schedule gap €2.04M. Different questions.

UNKNOWN The true IAM split of either residual.

Would change the cell: Any IAM % invented from 100% − PMS — refuse it.

Tender notice counts look like a revenue pool and are not.

Live: 376 opportunities · ~€55,786/yr GPS-addressable on 11 rows — footprint, not parts €.

UNKNOWN Award euros.

Would change the cell: Keep tenders out of the parts-revenue priority list.

The ICE peak window (2025–2032) is time-bounded; a new composite score will not extend it.

Stance: peak ICE D-Max / N-series parts window is open now. Scoring 0–100 is closed.

UNKNOWN Exact year of peak by market.

Would change the cell: Parc cohort by market — not a revived score.

Ready levers and five asks already on the table

Lead with what is already built: Book B alloc ambition, no-list ownership, and DE/BE/PT sell-out. Then the five signed asks. Nothing here is a new programme.

1

Book B (the price list we might change) — alloc ambition +4% / +5% / launch-only

6,326 PNs · €12.76M L12M already packed. +4% ≈ €510k/yr · +5% ≈ €638k/yr. Highest return-per-effort action available today. **No answer:** no DB-specific list move that survives the guardrails.

2

Name an owner for NO_LIST (~€4.96M / 251 PNs)

Cheapest euro on the table — a list/price governance fix, not a demand programme. **No answer:** the gap stays unowned inside the opportunity set.

3

Sign list-to-pocket — or keep realization internal

Year-matched list-to-net joins ran as validation. Until there is a written sign-off, this paper will not quote the pocket euro. **No answer:** Mode A packs stay silent on realization.

4

G1 — sign the forecast surface, or wait

Median WAPE 49.4% on 548 of 636 series is already on the table (normal for intermittent spares). Bias % and FVA vs naive still missing. **No answer:** forecast cannot go live; allocation cannot inherit it.

5

Account-health thresholds — calibrate before it is a call list

Draft flags: 10 RED / 6 AMBER of 17 · **thresholds_calibrated: false**. Defection: 25 alerts, 9 with zero trailing revenue. **No answer:** that queue is not a call list. Early warning on sales stays the call list until amber/red are signed.

> **NOT AN ASK** Nordic tender API keys — done. Gross/SPA on billing — closed, net-only forever. A new 0–100 score — closed. Oil-filter as the network opportunity lead — retired by the matrix. This paper is not a new programme on the build queue.

Also waiting: UK-truck brake 0.4 vs 0.8; DE/BE/PT sell-out files; growth-factor 1.24/1.25; DPO path before any telematics build; connected-vehicle position (build or written no).

What would change our mind

These are the smallest facts that would rewrite the thesis — not moving goalposts.

1. **Age-spend curves replacing flat €250/UIO** on the 8 placeholder markets. Would rewrite the 51.1% headline and the €29M residual.
2. **One family of independent unit counts** (oil or air, one large market). Would retire "IAM volume UNKNOWN."
3. **ISZE realised gross margin by category (CO-PA)**. Would replace Eucon scraped-set GP as the prioritisation layer.
4. **Written list-to-pocket sign-off** on year-matched joins — or kill the figure if the join fails.
5. **G1 on the forecast surface** (or an explicit wait), plus bias % / FVA vs naive.
6. **Germany or Belgium dealer sell-out long**. Would prove whether replenishment leakage is a five-DB story or a network pattern (path to 75.1% of billed euro).
7. **Next SAP extract with sales-type codes for Apr–Jun 2026**. Would confirm or reverse the credit/return judgment.
8. **A connected-vehicle / VIN decision** — build telematics or state in writing that ISZE will not.

> If none of these arrive, the thesis on page 1 still holds: we bill about half a ceiling that is 37% placeholder; the quotable gap is clutch and brake (€8.39M of €18.22M); Eucon GP and Book B are ready levers; independent volume is UNKNOWN; tenders are footprint not parts €.

Sources, as-of, verify stamp

Verify is green: 116 pass / 0 fail at 2026-08-25T17:19:54Z; billing through 2026-06-30; filenames live on this page only.

CLAIM IN THIS PAPER	DEFINITION / GRAIN	WHERE
51.1% · €30.76M / €60.22M · 37% flat €250	Parts billed vs max-spend ceiling; placeholder share of ceiling	max-spend waterfall CSV (assumption_note)
