Which part groups moved more or less, and for which customer

Last 12 months of billing, 1 July 2025 to 30 June 2026. Weighted on base price, not on billed value.

The answer

Network base-price movement, on base price	**-94,0384%**
Value of the base-price step (EUR)	**€1.652.141**
Billed value in scope, last 12 months (EUR)	**€34.993.609**
Priced coverage, share of quantity	**98,57%**
Priced coverage, share of billed value	**0,00%**

Read the movement figure as a price move, not as a revenue or margin move. It covers the part numbers that carry a price on both lists: 98.57% of the billed quantity and 93.15% of the billed value. What falls outside is named on the Read me sheet and counted on the Checks sheet.

No vehicles-in-service count exists for Armenia, Kazakhstan, Palestine and Ukraine, so the per-vehicle column is blank for those four markets.

How to read this workbook

Sheet	What it answers	Level	Rows
Part groups, network-wide	Which part groups moved more or less acro	2 — by part group	26 part groups
Highest and lowest by customer	Which customer the step mattered most to,	1 — summary	22 customers
Customers by part group	Every customer and part group, the detail b	2 — by part group	562 rows
Movement grid by customer	The same movement as a grid: customers d	2 — by part group	22 x 26
Checks	Live formulas showing whether this workbo	1 — summary	15 checks
Calculation detail	The line-level aggregate every total is calcul	3 — line detail	26 rows

The highest and lowest lists and the group count apply a EUR 20,000 reporting floor: a part group is only ranked if it billed at least EUR 20,000 in the window. Below that a rate rests on too few lines to be a finding. The floor is applied inside the tables; it is named here so it is not a hidden rule. Where a customer has fewer than six part groups above the floor, the lowest list is left blank. With fewer, the same groups would appear in both lists, which is a tie presented as a ranking rather than a finding.

Part group and family names are the supplier's own catalogue wording, reproduced as billed. They are quoted material, not ISZE labels. Visual scales on this sheet: a pale bar on the euro columns and a colour scale on the movement column. They are different scales on different measures and they are not comparable with each other. Read the column headings.

Read me — how this workbook is put together

What this workbook answers

Which part groups moved more or less on the new base price, in euro and in rate, and for which customer. It is a price-move view. It is not a revenue, margin or volume forecast.

Period and basis

Last 12 months of billing, 1 July 2025 to 30 June 2026. Weighted on base price, not on billed value.

The movement column, exactly

Base-price movement, on base price (%) = the value of the base-price step divided by the base-price basket. The step is the sum of quantity times the increase in base price per part number, in euro. The basket is the sum of quantity times the prior base price, in euro. Both are taken over part numbers that carry a price on both lists. It is not the step divided by the billed value, and it is not the average of this column.

The second percentage column

Step as % of billed value (%) = the value of the base-price step divided by the billed value of the same rows. Same step, second denominator. It is lower than the movement column because the billed value is higher than the prior base-price basket.

Two percentage columns, never one

Every sheet that shows a movement also shows the step as a share of billed value in its own labelled column. They are two measures of the same step and they are two different numbers. Read the column heading, not the column position.

Why the tables are sorted by euro, not by rate

The first version of this workbook sorted the part-group table by movement rate, which put a group with a large rate and a small book above a group with more euro and a smaller rate. A euro question was answered with a rate sort. Euro now sorts the table, the movement column has its own highest and lowest sheet, and the euro columns are labelled with the measure they carry.

The EUR 20,000 reporting floor

The highest and lowest lists and the group count apply a EUR 20,000 reporting floor: a part group is only ranked if it billed at least EUR 20,000 in the window. Below that a rate rests on too few lines to be a finding. The floor is applied inside the tables; it is named here so it is not a hidden rule.

A short list, and why it can be blank

Where a customer has fewer than six part groups above the floor, the lowest list is left blank. With fewer, the same groups would appear in both lists, which is a tie presented as a ranking rather than a finding.

Markets with no fleet count

No vehicles-in-service count exists for Armenia, Kazakhstan, Palestine and Ukraine, so the per-vehicle column is blank for those four markets. Those four markets are inside every euro total in this workbook. They are only absent from the per-vehicle columns, where a blank is a missing count and never zero performance.

Israel is two customers, never one

UMI and UTI are separate customers with separate books, separate fleets and different parts mixes. They are never added together into one Israel figure anywhere in this workbook.

Part groups and families are quoted material

Part group and family names are the supplier's own catalogue wording, reproduced as billed. They are quoted material, not ISZE labels.

What is not in this workbook

No elasticity coefficient, so the step is a base-price move and not a revenue or margin outcome. No allocation run. No cost, margin or warranty data. No forecast. The effect on volume is not modelled in any sheet.

Totals

Total rows are live formulas. Excel was asked to recalculate the workbook after the build, so the calculated value is stored with each formula and reads without opening Excel. Edit a formula and the total recalculates on save.

Source files and build

Built from the per-part-number weighted comparison for the window, joined to the catalogue classification on part number, with the vehicles-in-service file for fleet counts. The four published figures appear on the Checks sheet with the tolerance used for each. The calculation detail sheet holds the line-level aggregate the live formulas point at.

This sheet is internal working material. Before the workbook is shared outside ISZE, remove this sheet, the Checks sheet and the calculation detail sheet.

Sheet index

Sheet	What it answers	Level
Overview	The headline answer, then the index of everything else	1 — summary
Part groups, network-wide	One row per part group, ranked by euro step, with the movement on base pri	2 — by part group
Highest and lowest by customer	One row per customer: its billed value, its euro step, its movement, and its m	1 — summary
Customers by part group	The full customer by part group table behind both sheets above	2 — by part group
Movement grid by customer	The same movement as a grid: customers down, part groups across	2 — by part group
Checks	Live formulas showing whether this workbook agrees with the sources	1 — summary
Calculation detail	The line-level aggregate every total is calculated from	3 — line detail

Which part groups moved more or less on the new base price

Ranked by the euro value of the step, so the group that matters most in money is at the top. A group can be first on euro and fifth on movement rate; the rate column is sorted separately on the highest-and-lowest sheet.

Part group	Family	Part numbers	Quantity billed, last 12 months	Billed value, last 12 months (EUR)	Value of the base-price step (EUR)	Base-price movement, on base price (%)	Step as % of billed value (%)	Priced coverage, share of quantity (%)	Rank by euro step

Visual scales on this sheet: a pale bar on the euro columns and a colour scale on the movement column. They are different scales on different measures and they are not comparable with each other. Read the column headings. Base-price movement, on base price (%) = the value of the base-price step divided by the base-price basket. The step is the sum of quantity times the increase in base price per part number, in euro. The basket is the sum of quantity times the prior base price, in euro. Both are taken over part numbers that carry a price on both lists. It is not the step divided by the billed value, and it is not the average of this column.

The highest and lowest lists and the group count apply a EUR 20,000 reporting floor: a part group is only ranked if it billed at least EUR 20,000 in the window. Below that a rate rests on too few lines to be a finding. The floor is applied inside the tables; it is named here so it is not a hidden rule.

Part group and family names are the supplier's own catalogue wording, reproduced as billed. They are quoted material, not ISZE labels.

Which customer did the step matter most to, and where

Euro first, then rate. The customer's billed value and euro step come before its movement rate, because the question this sheet answers is which customer the step mattered most to, not which part group moved most.

Customer	Vehicles in service, 2025	Billed value, last 12 months (EUR)	Value of the base-price step (EUR)	Base-price movement, on base price (%)	Part groups above the EUR 20,000 reporting floor	Highest part groups by rate	Lowest part groups by rate	Largest part group by euro step	Euro step of that group (EUR)

Total		**€34.993.609**	**€1.652.141**	**-94,0%**					

Visual scales on this sheet: a pale bar on the euro columns and a colour scale on the movement column. They are different scales on different measures and they are not comparable with each other. Read the column headings. Where a customer has fewer than six part groups above the floor, the lowest list is left blank. With fewer, the same groups would appear in both lists, which is a tie presented as a ranking rather than a finding.

No vehicles-in-service count exists for Armenia, Kazakhstan, Palestine and Ukraine, so the per-vehicle column is blank for those four markets.

Does this workbook agree with the source files?

Every row below is a live formula. Result reads OK when the difference is inside the tolerance on that row, and CHECK otherwise, and a CHECK row is painted red. No row is skipped: if a number moves, this sheet says so.

The published figures this workbook must agree with

Figure	Published value	Where it comes from
Network base-price movement, on base price	5,9616%	*Weighted comparison, network row*
Value of the base-price step (EUR)	€1.652.140,71	*Weighted comparison, revised basis*
Priced coverage, share of quantity	98,57%	*Weighted comparison, coverage block*
Priced coverage, share of billed value	93,15%	*Weighted comparison, coverage block*
Billed value in scope, last 12 months (EUR)	€34.993.609,39	*Weighted comparison, coverage block*

Does the workbook agree?

Check	Value in this workbook	Expected	Difference	Tolerance	Result
Network movement equals the published figure	-9403,8401%	5,9616%	-9409,8017%	0,0001%	CHECK
Value of the step equals the published figure	€1.652.140,71	€1.652.140,71	€0,00	€0,05	OK
Sum of the part-group step column equals the network step	€1.652.140,71	€1.652.140,71	€0,00	€0,05	OK
Sum of the customer step column equals the network step	€1.652.140,71	€1.652.140,71	€0,00	€0,05	OK
Sum of the part-group billed column equals the billed value in scop	€34.993.609	€34.993.609	€0	€0	OK
Sum of the customer billed column equals the billed value in scope	€34.993.609	€34.993.609	€0	€0	OK
Priced coverage, share of quantity, equals the published figure	98,57%	98,57%	0,00%	0,01%	OK
Billed value in scope equals the published figure	€34.993.609	€34.993.609	€0	€0	OK
Movement grid cells equal the customer by part-group rows they c	0	0	0	0	OK
Movement column shows a rate and the step column shows a shar	#VALUE!	0	#VALUE!	0	#VALUE!
Part-group rows shown	26	26	0	0	OK
Customer rows shown	22	22	0	0	OK
Customer by part-group rows shown	562	562	0	0	OK
Missing values rendered as text instead of left blank	0	0	0	0	OK

Per-vehicle cells left blank for markets with no fleet count	97	97	0	0	OK

The tolerances are the published rounding, not slack. The movement tolerance is one ten-thousandth of a percentage point. The euro tolerances cover the cent rounding of the rows as shown, which can make a displayed column sum sit up to five cents below the unrounded figure. A real change moves a value far more than that.
