AIM

The parts classification behind better decisions

MANAGEMENT PRESENTATION

One part identity. A better commercial decision.

How AIM can support distributor competitiveness and ISZE growth.

20 SEPTEMBER 2026

Turn "Others" into the next sales opportunity.

The data already exists. AIM makes the product questions easier to answer.

SEE

What is inside?

Separate mixed turnover into recognisable service and repair ranges.

COMPARE

Where is the opportunity?

Compare the same range by distributor, vehicle population and period.

ACT

What will win the business?

Target the product range, distributor support and availability where they can change the result.

AIM connects the catalogue to commercial action.

One common product language supports several decisions.

EXISTING INFORMATION

Part number
Description
Catalogue reference
Customs and price data
ZKK reference

→

AIM

Family
Product group
Detailed part type

→

Sales explanation

Pricing precision

Market comparison

Service-range opportunity

The same part can be analysed consistently across products, markets and commercial actions.

A large "Others" group hid very different businesses.

We could see turnover without seeing which product range deserved action.

OTHERS

Mixed products.
Mixed reasons to buy.

Filters
Repeat-service potential

Brakes
Wear-range development

Clutch
Repair-job opportunity

Cooling
Product and availability

Electrical
Specific component demand

Body
Repair and accident mix

The opportunity is not to rename "Others". It is to reveal what we can sell differently.

5+1: use the information around the part, not only its name.

Five original master-data fields, reinforced by Japan's ZKK reference.

5	**Part number**	Connect the same item across sources and sales.
	Description	Identify the item, not merely a word in its name.
	Catalogue figure	Place the item in its technical context.
	Customs code	Cross-check the broad product grouping.
	Price	Understand economic spread and pricing relevance.
+1	**ZKK reference**	Reinforce the review; preserve Japan's original code.

Identity evidence determines the product. Price adds commercial context. ZKK reinforces the reference.

5+1 describes evidence roles, not six equal votes or a certified automated score.

A short description starts the question. Context resolves it.

The classification becomes more useful when the sources are read together.

ILLUSTRATIVE READING OF THE METHOD

"FILTER; ACL"

The abbreviation alone is not enough for a reliable commercial range.

Catalogue context

Air-cleaner assembly

Product wording

Element, housing or kit?

Reference check

Customs / ZKK / reviewed evidence

Accepted product identity

An air-cleaner element where evidence supports it.

A reviewed correction is retained, so the next update does not repeat the same ambiguity.

Every level answers a question the level above cannot.

A commercial review moves from the business area to the specific product.

01 CLUTCH

Which business area needs attention?

Review the clutch family.

02 RELEASE SYSTEM

Which part of the range explains the result?

Separate release components from discs and plates.

03 SLAVE CYLINDER

Which product should the team investigate?

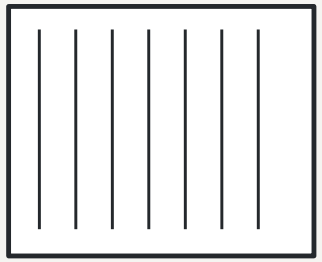

Review applications and relevant part numbers.

The family creates focus. The group explains the pattern. The part type makes the action precise.

Example path: supplied corrected ISZE master, reviewed 20 September 2026.

An element, a housing and a kit are different products.

The broad filtration family is useful; the detailed type makes comparisons meaningful.

Filter element

A recurring replacement item.

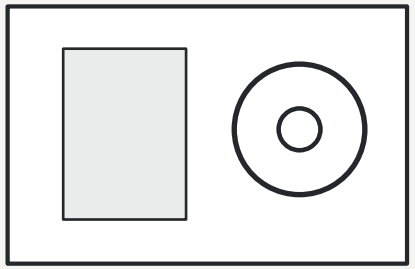

Compare the relevant service need.

Filter housing

A different repair requirement.

Compare the correct assembly.

Maintenance kit

Several validated contents.

Compare the complete service basket.

AIM brings the selling range together; ZKK stays intact.

Japan's reference information reinforces AIM without replacing its structure.

10

ZKK codes

→

BRAKE PAD KIT

One recognisable product type
for a sales or price review.

37 matched master records retain their original Japanese codes.

Source: supplied master/Japan-reference review, 20 Sep 2026. Record counts, not units sold.

Find the product movement behind the turnover headline.

AIM lets the same result be examined at family, product-group and part level.

THE HEADLINE

"Sales are up."

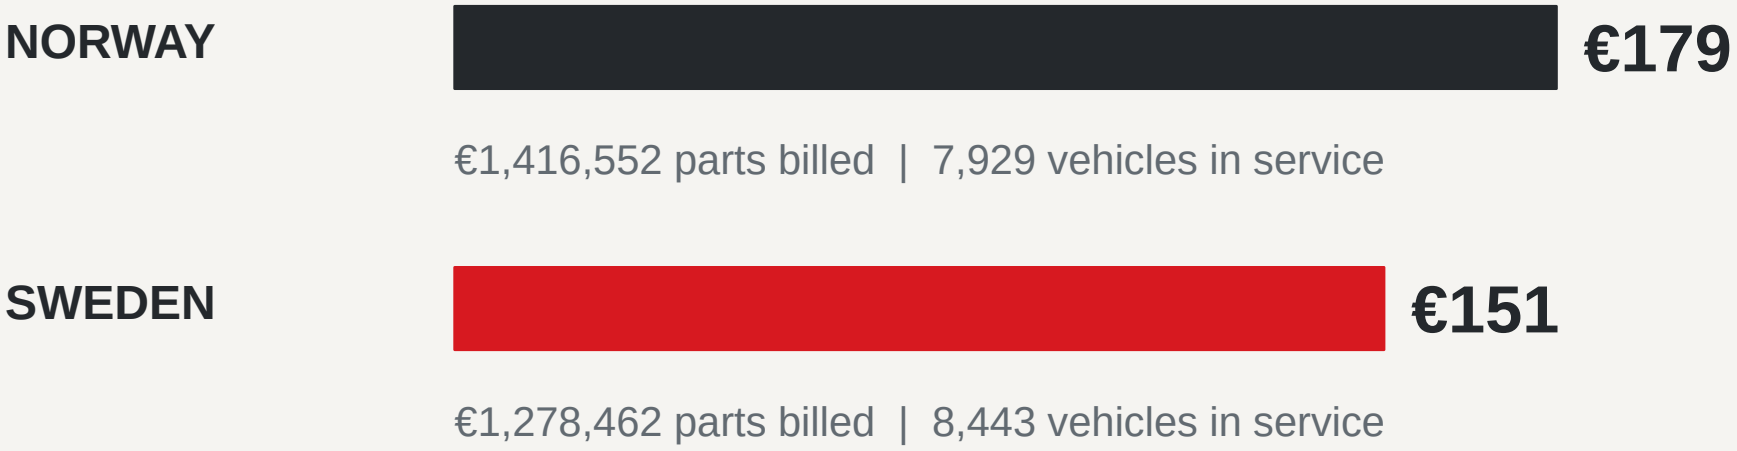

Useful, but not yet a diagnosis.

PRICE	Did the same parts sell at a different net price?
VOLUME	Did comparable quantities or repeat orders change?
MIX	Did kits, value parts or high-value repairs change the result?
CONCENTRATION	Is the family movement really one large part number?

More repeat-service business and a one-off major repair demand different follow-up.

Market size can hide the more useful question: spend per vehicle.

Calendar 2025 parts billed per vehicle in service: a starting signal for category review.

AIM adds the next question: **Which product family explains the difference?**

Source: ISZE numbers context, 19 Sep 2026; calendar 2025. Match vehicle mix before setting a target.

Compare the same product question in each market.

AIM supplies a common range; the comparison then controls for the business context.

PRODUCT

The same type and applicable range

→

FLEET

Relevant vehicles and operating use

→

PERIOD

The same months and sales stage

→

RESULT

Volume, spend per vehicle and contribution

Transfer the winning practice, not the raw country average.

Check the range, stock policy, product mix and dealer execution behind the stronger pattern.

Find the range that is underrepresented in the fleet it serves.

Three complementary views turn a broad market question into a product question.

€ / vehicle

How much of the relevant parts business reaches ISZE?

Parts billed in the category / relevant vehicles in service

Service cover

How much of the modelled replacement need did we supply?

Comparable actual units / expected service units

Account breadth

Which eligible accounts buy this range repeatedly?

Repeat buyers / identified eligible accounts

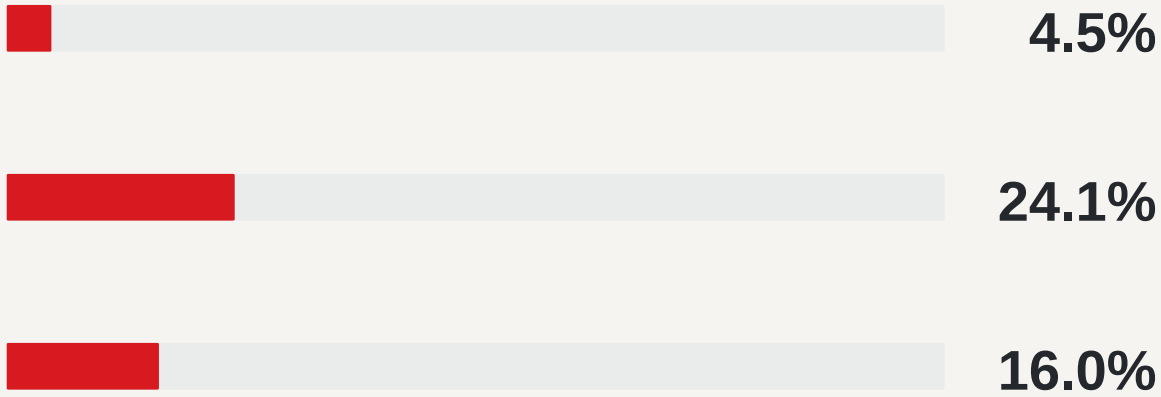

Choose the product range, define its opportunity, then identify the accounts to approach.

Service cover is measured against a modelled expectation, not a verified share of competitor purchases.

One fleet. Three different commercial questions.

IUK, the UK light-commercial distributor | Calendar 2025 | 47,783 vehicles in service

MODELLED CATEGORY GAP		SHARE OF EXPECTED UNITS SUPPLIED
Clutch disc	€1.338M	4.5%
Brake pad	€0.807M	24.1%
Fuel filter	€0.485M	16.0%

Use AIM to investigate each category with IUK - not treat all three as one purchasing gap.

Source: ISZE numbers context, 19 Sep 2026. Individual modelled gaps; not confirmed competitor turnover.

Separate weakening purchases from untapped potential.

The same low category total can require a different distributor discussion.

ILLUSTRATIVE PATTERNS - NOT CURRENT MARKET RESULTS

 **Previously regular; now weaker**	Identify the parts that stopped repeating and when the pattern changed.
 **Historically underdeveloped**	Confirm the relevant fleet, applications and current buying route.
 **Purchases moved within the range**	Check value parts, kits and order timing before treating it as lost business.

Diagnose the purchasing pattern before choosing the distributor action.

Find where the category weakness is concentrated.

A stable family total can hide declining purchases of specific products.

TEST THE PRODUCT RANGE	
Whole family	What is the overall movement?
Largest part numbers	Which lines explain the change?
Rest of the family	Does the same pattern remain?

TEST THE ACCOUNT BASE

Widespread or concentrated?

Use sales to dealer where available to identify whether a few accounts explain the category pattern.

No dealer data? Keep the conclusion at distributor level.

Identify the product movement, establish its cause with the distributor, and target the support accordingly.

Check substitution before calling it lost business.

AIM links the relevant products without making components, kits and value parts identical.

PATTERN TO CHECK	WHAT TO CHECK WITH THE DISTRIBUTOR
Original down / value up	→ Check original and value parts together, with their combined contribution.
Components down / kits up	→ Verify kit contents and comparable quantities. Count each billed kit once.
Some related parts rarely bought	→ Check applications, stock and buying routes before calling a missing companion part a lost sale.

AIM distinguishes a change in buying mix from a question about business lost.

Give distributors room to compete on the right lines.

Pricing is one response to the analysis - not the starting explanation for every gap.

DEFINE THE SUPPORT

Selected part numbers.
One distributor.
An agreed period.

Comparable evidence

Confirm the product, local alternative and terms.

Commercial room

Target the ISZE terms that help the distributor compete.

Contribution protected

Test repeat purchasing and achieved contribution.

Support the justified lines; preserve margin on the rest of the family.

Distributors need the right stock behind each range.

Product-level insight can concentrate availability work on the ranges that matter commercially.

01

What repeats?

Separate recurring service items from occasional high-value repairs.

02

What is missing?

Identify the applications or companion items the distributor cannot supply.

03

What should change?

Agree the stock or range action with the distributor.

Use the same product range for the sales conversation and the availability review.

The largest category is not always the best next opportunity.

Prioritise the opportunity with scale, evidence, contribution and a distributor ready to act.

1	**Relevant opportunity**	Which product family and fleet create the need?
2	**Evidence of a viable action**	Do we know the alternative, terms and availability?
3	**Contribution after support**	Will additional business justify the support and its costs?
4	**Ability to execute**	Which distributor or dealer will act, by when, and with what stock?

A small, executable product action can be worth more than a large, unqualified gap.

Take one product opportunity into the meeting, not a catalogue of charts.

A shared category review should make the next action clear to both sides.

PRODUCT RANGE / DISTRIBUTOR / PERIOD	
What we observe	Parts billed, repeated orders and relevant fleet.
What we need to explain	Range, applications, terms and availability.
What we agree	Selected product action, owner and review date.

Useful for the distributor

A recognisable range.
A defined purchasing gap.
An agreed distributor action.
A result to review together.

Review the changes, not the whole catalogue.

Vehicle Parts Sales owns the local process within the existing ISZE master.

Accepted version

Keep reviewed classifications.

→

New information

Identify new parts and changed evidence.

→

Exception review

Resolve only the items that need it.

→

Next accepted version

Retain decisions and their history.

Corrections survive the next update.

No dependency on regular bespoke updates from Japan.

A replacement should not look like lost business.

ITC will connect authorised old-to-new relationships when the source is supplied.

OLD PART NUMBER

REPLACEMENT NUMBER

Purchases on this number fall.

Purchases move here.

Preserve the original invoice; add a validated replacement-family view for sales continuity.

Illustrative relationship only. Interchangeability data has not yet been supplied.

AIM

From "Others" to a product. From a product to an opportunity.

THE MANAGEMENT DECISION

Use

One accepted product language for distributor sales reviews.

Own

Local maintenance within Vehicle Parts Sales.

Prove

One reviewed range; repeat orders and contribution.

How AIM can support distributor competitiveness and ISZE growth.
