ISZE dashboard audit

Every live dashboard under 02_dashboards, checked against the house rules.

Run 2026-09-16 · five parallel audit passes, one independent verify pass · read-only

> The dashboards are in better shape than the finding count suggests, and worse in one specific way: a handful of root causes account for most findings, and two of them stop pages from working at all. No CDN except Google Fonts and Leaflet. No chart library is missing from disk. But two dashboards render empty because a data script is referenced that was never generated, and the dealer-compare family is not offline-capable despite saying so in its own footer.

111	9	102
LIVE DASHBOARDS HTML files excluding _archive, _build, _qa and Data	ROOT CAUSES Distinct defects behind the findings	FILES, HIGH Blank page, wrong number, or unreadable text

4	23
CLAIMS OVERTURNED Auditor findings the verify pass disproved	REDUNDANT COPIES Byte-identical, verified by SHA-256

Root causes, ranked

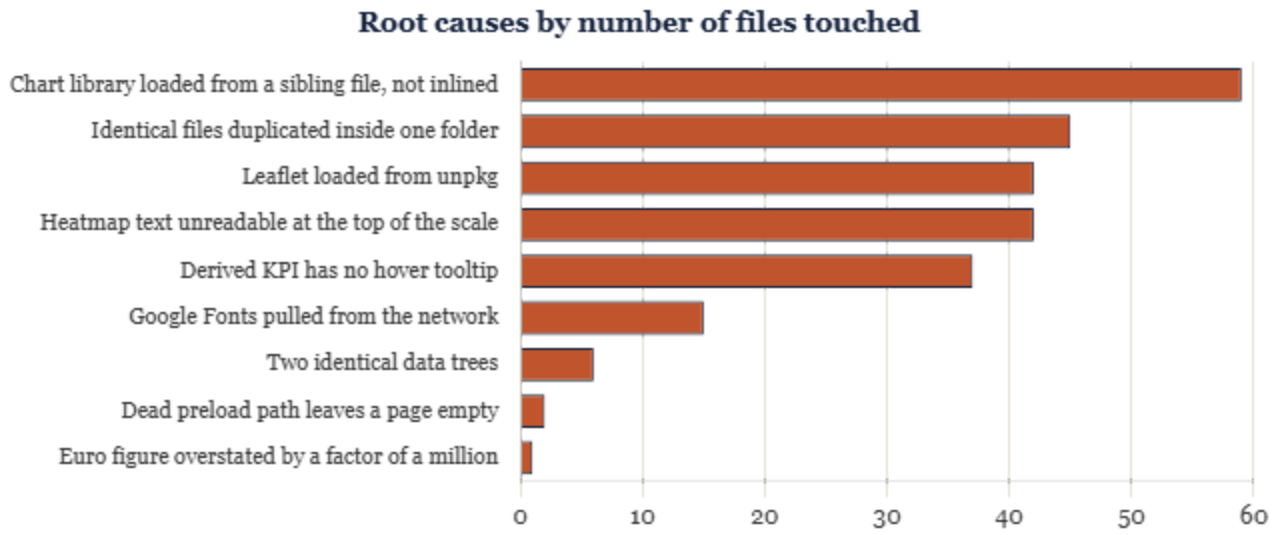

The same few defects repeat across folders. Fixing the first one clears 15 files at once.

Defect	Files	Severity	Evidence, why it matters, and the fix
Leaflet loaded from unpkg NO CDN	42	HIGH	`IDS_2026_dealer_compare.html line 9 loads the unpkg stylesheet; line 1402 document.write's the unpkg script at runtime`

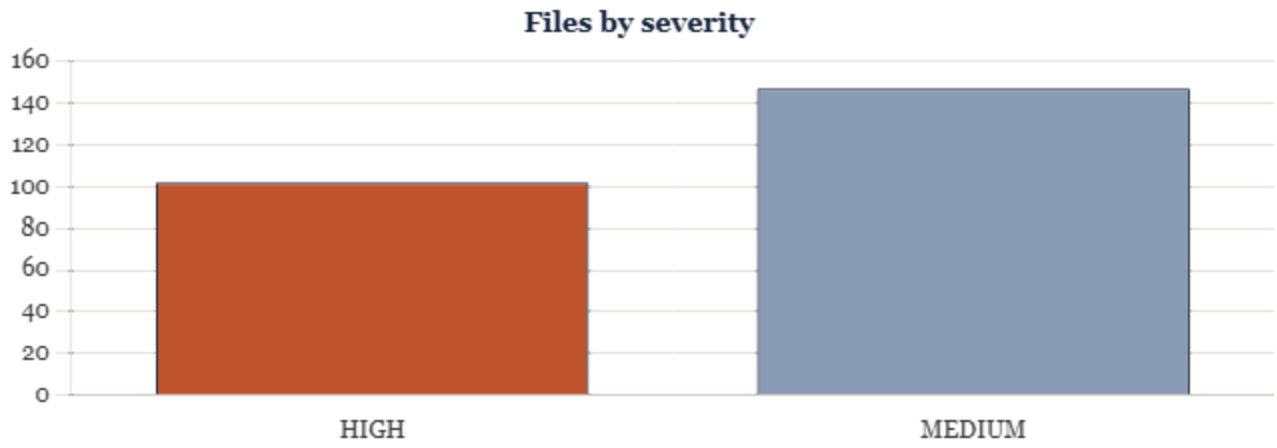

Defect	Files	Severity	Evidence, why it matters, and the fix
			The dealer-compare family is not self-contained, though its own footer claims 'Single-file offline dashboard'. **Fix:** Inline _ui/leaflet.js (147 KB) the way the study files already inline Chart.js (200 KB).
Heatmap text unreadable at the top of the scale CONTRAST	42	HIGH	`IDS_2026_dealer_compare.html:83 sets .hm-cell{color:#fff} while heatBg (1062-1063) returns hsl(155,45%,60%) and hsl(12,55%,70%)` Fixed white digits on a pale green or salmon fill, about 2:1. Not the described bug shape, but the same outcome. **Fix:** Pick the ink colour from the computed lightness instead of hard-coding #fff.
Google Fonts pulled from the network NO CDN	15	HIGH	`_ui/editorial.css line 2: @import url('https://fonts.googleapis.com/css2?family=Fraunces&family=Inter&display=swap')` One import in a shared stylesheet makes every page that links it network-dependent. Offline, the house typeface silently falls back to Georgia/system. **Fix:** Self-host the two fonts as woff2 and drop the @import. One change clears it for every page.
Dead preload path leaves a page empty CHART/DATA INTEGRITY	2	HIGH	`hub/MASTER_DASHBOARD.html:272 needs Data/dashboards/viz/risk_cockpit.preload.js; ops/ISZE_Tender_Monitor_v2.html:490 needs Data/dashboards/tender_data.preload.js` Only the .json files exist at those paths, never the .preload.js. On file:// the fetch fallback is blocked, so 5 KPI chips stay em-dashes and the Tender OS falls to its offline banner. **Fix:** Generate the .preload.js siblings from the .json files, or point the script tags at the JSON loader the rest of the folder uses.
Euro figure overstated by a factor of a million NO INVENTED FIGURES	1	HIGH	`pricing/ISZE_Pricing_History_Findings_Dashboard.html:57 shows EUR 30,422,371.9M where the sibling pack (:89) shows EUR 30.4M for the same 2023 row` A unit suffix is appended to a value already in units. It reads as 30 trillion euro. One raw nan cell also leaks at line 72. **Fix:** Divide by 1e6 before appending M, and render nan as an em-dash like the sibling pack does.

Defect	Files	Severity	Evidence, why it matters, and the fix
Chart library loaded from a sibling file, not inlined SELF-CONTAINED	59	MEDIUM	`e.g. pricing/ISZE_Aftermarket_Live_Pricing_Dashboard.html:72 <script src="../_ui/plotly.min.js"></script>` Renders in place, but any move or copy yields blank charts. _ui/plotly.min.js is 4.8 MB, so inlining is not free either. **Fix:** Decide per file: inline the small ones (chart.umd 200 KB), document the _ui/ dependency for the large ones.
Identical files duplicated inside one folder EMPTY SHELLS / DUPLICATION	45	MEDIUM	`ids/: 22 hash groups covering 45 files, 23 of them redundant` Country dashboards exist twice, at top level and under IDS_all_dashboards_2026-08-19/. Verified by SHA-256, not by name. The nested copies also carry a broken ../_ui/ path. **Fix:** Keep one copy and delete the nested tree, or delete the top-level duplicates.
Derived KPI has no hover tooltip KPI EXPLAINERS	37	MEDIUM	`pricing/ISZE_Pricing_Action_Map.html uses a bare title= attribute on heat cells; the file contains no .tip rule` The house rule says a title= attribute alone does not satisfy it. A reader cannot see the formula, snapshot date, or exclusions. **Fix:** Add the .tip hover pattern the compliant files already use (e.g. ISZE_Action_Ledger_Hub.html).
Two identical data trees STRUCTURE	6	MEDIUM	`Data/dashboards and Data/14_dashboards hold the same 6 filenames` Two locations for the same data. Which one a dashboard reads depends on the relative path it happens to use. **Fix:** Pick one as canonical and leave a pointer at the other.

Where the work is

Files affected by severity

What the live set looks like

Folder	Live HTML

spa_internal	1

Claims the verify pass overturned

Each audit group was told to report only what it could confirm in the files. Four claims did not survive an independent check. These are recorded because a wrong finding is worse than no finding: it sends someone to edit a file that was never broken.

Auditor claim	What the files actually show	Group
Pricing_History_Findings_Dashboard ships 5 hardcoded euro KPIs	3, at lines 282, 287 and 292. Two of the five did not match the pattern the auditor said it grepped.	sales
side/PROPERTIQ.html has 7 blank photo backgrounds because propertiq-assets is empty	False. The folder holds 3 files and all 3 referenced images exist. The auditor appears to have checked the wrong path.	hub/ops/side
side/PROPERTIQ.html has unresolved Dutch text rendering as mojibake	False positive. The replacement character was a console encoding artefact, not file corruption.	hub/ops/side
MASTER_DASHBOARD's real data file is at Data/14_dashboards/viz/risk_cockpit.preload.js	That file does not exist either. Only the .json exists, in both trees. The break is real; the proposed fix was wrong.	hub/ops/side

And three counts that moved

Under-counts rather than fabrications, but the numbers were not usable until recounted.

Measured	Reported	Verified	Group
Shared stylesheet reach	4 files	15 live files	`fleet auditor`
Byte-identical duplicates	20 of 53 files	45 files in 22 groups (23 redundant)	`ids auditor`
Hardcoded euro KPIs	5	3	`sales auditor`

What is genuinely clean

- **No chart library is missing from disk.** `chart.umd.min.js` (200,807 bytes), `plotly.min.js` (4,847,499), `echarts.min.js` (1,029,203), `leaflet.js` (147,552) are all present in `_ui/`.
- **No source maps shipped.** Zero `sourceMappingURL` occurrences across the audited files and the libraries.
- **No invented live statistics.** No occupancy percentage, live stock or live price is presented as current. The only occurrences of those words are explicit disclaimers.
- **Contrast is mostly deliberate.** The repeated white-on-dark header pattern (navy or red gradient) is intentional, not the pale-background bug. One auditor correctly refused to report a match that happened to be light text on a dark gradient.
- **Tooltips exist where they were built.** Six files implement the hover pattern properly, including full run-id provenance in `ISZE_Action_Ledger_Hub.html`.
- **Four files clean across every rule tested:** `hub/index.html`, `hub/BI_PACKS.html`, `ops/ISZE_OS_Data_Map.html`, `ops/ISZE_Action_Ledger_Hub.html`.

Two decisions this needs from you

1. The chart libraries. `plotly.min.js` is 4.8 MB. Inlining it into each dashboard would add roughly 5 MB per file and is probably the wrong answer. The rule as written says inline; that rule was made for Chart.js at 200 KB. Either accept a documented `_ui/` dependency for the large libraries, or move those dashboards to a served URL where relative paths are stable.

2. The duplicate tree. 23 redundant dashboards in `ids/` plus two identical data trees. Deleting the nested copy is safe on the hashes but will break any link that points into it. That is a call for you, not for me.

Method and limits

- **How this was checked.** Five audit passes ran in parallel, one per folder group, each read-only and required to quote a file, line and rule. A separate pass then re-checked every high-severity fact by grep, read and headless render.
- **Counts on this page are recomputed from the files** at build time, not copied from the audit summaries. That is why three of them disagree with what the audit passes reported.
- **The pipeline a dashboard reads from was never touched.** No file was modified. No dashboard was rebuilt. No derived data was regenerated.
- **What was not checked.** The 39 IDS files below the size cap were not read individually. Contrast was assessed from the CSS cascade plus headless renders of two pages, not every page. KPI tooltips were judged on the presence of a hover mechanism, not on whether each tooltip text is correct.
- **Known soft spot.** The unreadable-tab finding in `ISZE_Monthly_Sales_Tracker.html` was left unconfirmed. The cascade is real, but the render did not settle whether the tab strip receives a dark background. It is recorded as unproven rather than promoted to HIGH.

Built 2026-09-16. Read-only audit; nothing modified. Charts rendered from inline Chart.js, no CDN.
