EUROPE / AFTERSALES

WHITE PAPER
22 September 2026
Proposed product / for review

Universe

A commercial edge.
A better reason to share.

Distinctive tools for product analysis, dealer development, range planning, commercial economics and market intelligence.

Give the network capabilities worth using.
Use relevant information to make those tools better.

Basic service is not the product.
Routine availability, ordinary BVP/application lookups and day-to-day support remain outside Universe.

COMMERCIAL TOOLS EDITION
Rewritten from the supplied papers under the business owner's revised scope. New tool designs and potential benefits are proposals, not operational or financial results.

READING GUIDE

From the commercial promise to the proof.

Read the product proposition first. Use the later chapters for evidence, participation, economics and delivery.

Chapter	Pages
The commercial promise and the scope boundary	3-7
AIM Commercial Atlas and the ITUK example	8-9
IDS Development Studio and fair comparison	10-11
Range & Campaign Planner and the Portugal example	12-13
Pricing & Margin Lab and explicit arithmetic	14-15
PRISM Market Intelligence and pursuit decisions	16-17
Deep analysis, initiatives and information exchange	18-21
Participation and the two distinct pilots	22-24
Reuse, evaluation, economics and funding	25-28
Delivery, analytical boundaries and extensions	29-31
Acceptance and source record	32-33

The paper describes the tools and their commercial purpose. The companion presentation explains the proposition; the HTML makes the connections and proposed tool journeys explorable.

The five-tool portfolio is a proposed design under the current business-owner scope. Source-derived observations keep their original dates and definitions.

COMMERCIAL TOOLS / PROPOSED PRODUCT

A commercial edge, not another support desk.

Universe should give distributors and dealers tools that change how they understand and develop their parts business.

The programme is a portfolio of distinctive commercial tools built around Isuzu product knowledge, deep purchasing analysis, dealer self-assessment and relevant market evidence. The user should be able to discover a range issue, understand a commercial movement, compare alternatives or choose an improvement directly in the tool. Opening a request for somebody else to answer is not the defining interaction.

The proposed portfolio comprises the AIM Commercial Atlas, IDS Development Studio, Range & Campaign Planner, Pricing & Margin Lab and PRISM Market Intelligence. The names identify proposed tool directions, not a claim that every capability is operational. The tools connect when that improves a decision, and remain useful independently when other evidence is unavailable.

The participant return comes first. A distributor receives a clearer basis for national and network priorities. A dealer receives a useful view of its own supported business and development choices. Isuzu Motors Europe (ISZE) receives better product and market understanding through an exchange that participants can judge valuable in its own right. More purchases from ISZE alone do not establish that a dealer gained.

Standard availability enquiries, ordinary part and BVP lookups, routine quotation handling and day-to-day support administration are outside this programme. They remain existing services, whether or not a participant contributes information to Universe. Evidence from normal operations may inform an agreed commercial analysis; their operating workflows do not become Universe modules.

> **The first proof is a useful commercial capability in the participant's hands: a better decision, a relevant output and a credible reason to use the tool again.**

Scope: [U]. Retained foundations: [C], pp. 6-14; [W], pp. 24-30, 48-54. Product portfolio and decision criteria: new proposals [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

The boundary is explicit.

Commercial analysis belongs inside; basic information and transaction handling stay in the existing business.

Outside Universe	Inside the proposed tools
When will this part arrive?	Recurring, evidenced constraints may inform a strategic range study; no arrival-enquiry workflow.
Is a BVP alternative available?	Combined Genuine/BVP positioning, product composition and range-development analysis.
Can you handle this quotation?	Competitive evidence and transparent economics for a selected pricing or range decision.
Can you follow up this training action?	An explorable IDS profile and a participant-chosen business-development plan.
Can you submit or administer this tender?	Relevant fleet/tender intelligence and a reasoned decision about which opportunities to pursue.

The test is not whether a normal service can be made more sophisticated. It is whether the proposed tool adds a commercial capability beyond that service. It should help a user see something materially useful, compare a choice or evaluate an initiative without creating a parallel operational process.

Basic support is neither a reward for participation nor a bargaining instrument for additional data. No participant should have to provide sales history, workshop records, margins or customer details to receive the ordinary service it should already receive.

Keep evidence when it improves the analysis. Do not import the day-to-day service into the product.

[U], current scope clarification. Earlier routine-support descriptions in [C], pp. 15-18 and 23-24, and [W], pp. 20-25, are deliberately replaced, not silently relabelled.

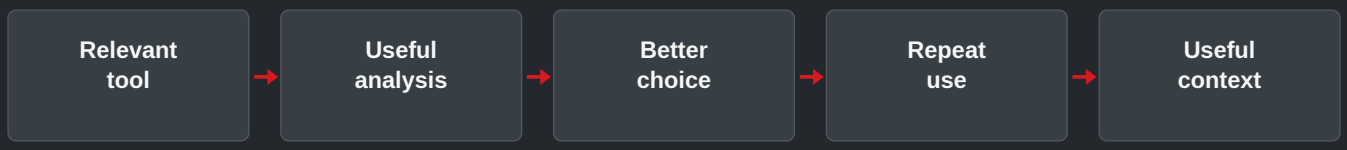

COMMERCIAL TOOLS / PROPOSED PRODUCT

Give people a reason to contribute.

A reporting obligation can start an exchange; a useful tool must earn its continuation.

The business owner describes many years of difficult and inefficient distributor-data requests, with insufficient visible value returned to the contributor. That history is not a claim that every distributor refused to cooperate. It explains why another request form, portal or report is not enough.

In 2025, ISZE began requesting major key performance indicators (KPIs), with **20% of the normal distributor kickback linked to reporting**, as confirmed by the business owner on 22 September 2026. This is a share of the existing rebate, not 20% of purchases, a new Universe incentive or a statement that the balance is unconditional. The existing agreement determines the actual conditions; the paper does not invent them.

Proposed analytical sequence. The arrows do not represent a measured effect.

The new proposition is specific: use the information already provided to make a valuable tool relevant to the participant's business. A contributor should see the difference its information makes: from national to own-account analysis, from a questionnaire to an assessment profile, or from a general range to a selected commercial initiative.

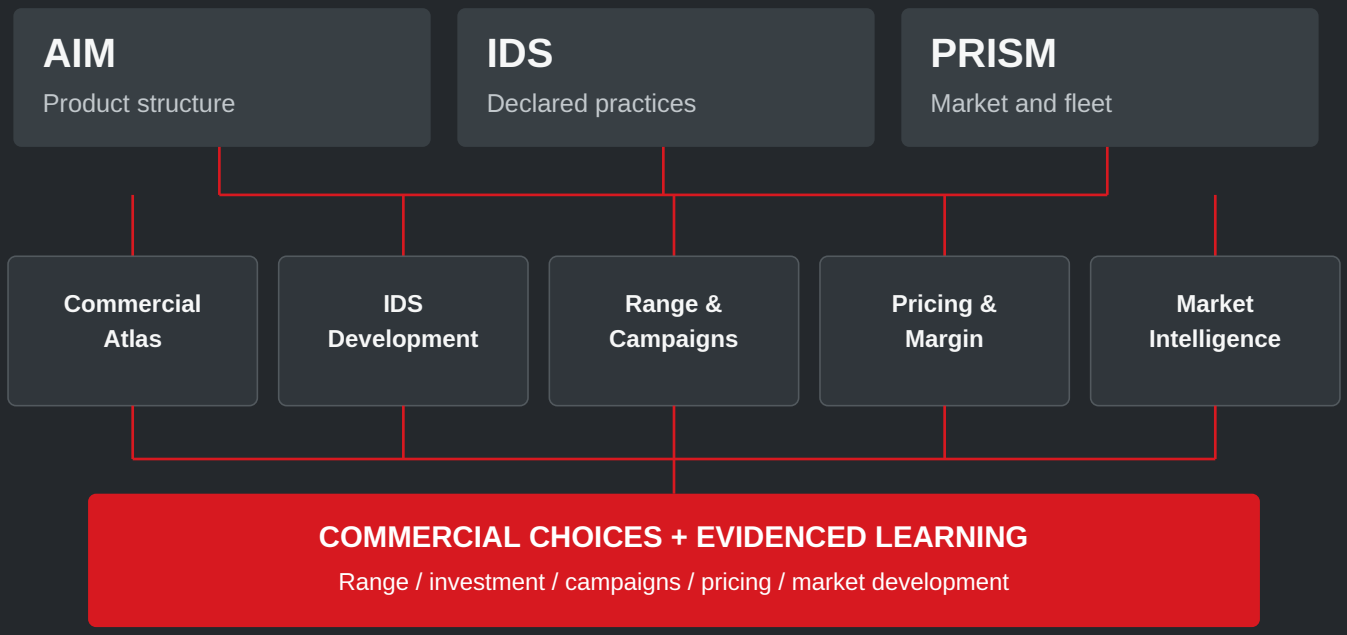

Additional information is earned for a defined analytical purpose. The participant should know which function becomes possible, the smallest acceptable contribution, the permitted audience and what remains available without it. A useful one-off aggregate may be preferable to a recurring export. Tool usefulness, recurring reporting compliance and voluntary enrichment must be measured separately.

History and rebate basis: owner statement recorded in [C], pp. 3-5, dated 22 September 2026. Revised reinforcing mechanism: [U; E]. It is a hypothesis, not measured adoption.

COMMERCIAL TOOLS / PROPOSED PRODUCT

One portfolio. Different commercial decisions.

AIM, IDS and PRISM contribute distinct knowledge; the tools turn it into usable choices.

Proposed product architecture. Each tool uses only the evidence relevant to its decision; the diagram does not certify live integration. [U; E]

AIM provides product structure and original-reference detail. IDS provides recorded dealer self-assessment. PRISM provides commercial and historical fleet context with explicitly modelled expectations where applicable. None is an automatic explanation of the other. A product classification does not prove demand; an assessment does not prove the cause of a sales result.

The common selection is the business entity, supported account or national scope, period, product range, source basis and permitted audience. It allows a user to carry a meaningful selection from the Atlas into a range plan or a scenario without reconstructing it. An IDS plan need not use pricing data. A pricing study need not use an assessment.

Connect the tools because the next decision becomes better, not because every component needs an arrow to every other component.

Retained distinctions: [C], p. 6; [W], pp. 48-51. Tool-first organisation and architecture: [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

The participant receives a usable capability.

The commercial return must be visible to the person supplying information and to the person making the decision.

Participant	Useful capability	Commercial choice
Dealer management	Own supported Atlas view; own IDS profile; a selected range or scenario analysis.	Choose a product initiative or development priority relevant to its own business.
Distributor parts and management	National and validated account analysis; range planning; comparable commercial evidence.	Concentrate effort, develop the offer and evaluate initiatives with its network.
ISZE commercial team	Product-level market understanding; evidence for selected prices, range choices and support.	Direct commercial effort and product development, while testing what creates value.

The return is not a promise of more sales before the evidence exists. It is access to analysis and planning capabilities that the participant can use to make a better choice. It may reveal that the current range is appropriate, a proposed campaign should be narrower, a comparison is unsuitable or no concession is justified.

The distributor retains its national commercial relationship. Dealer views contain only permitted own-business information. The person preparing an extract should not have to repeat definitions already accepted or provide the same information to several teams. The user benefits without surrendering every commercial record.

> **The product must be useful to the participant, not merely a more detailed way for ISZE to ask why it buys less.**

Participant relationship and information boundaries: [C], pp. 5, 16-17, 21-22; [W], pp. 9-12, 68-69. Revised tool return: [U; E].

PRODUCT / AIM

AIM Commercial Atlas

See what is really changing in the parts business.

The Aftermarket Intelligence Model (AIM) turns original part references into a navigable commercial range. The Atlas lets the user move from distributor or purchasing-account activity into families, product forms and exact references, while keeping the selected period and sales stage intact. It is both an exploration tool and a way to isolate the products that deserve a decision.

A distributor should be able to explain which ranges strengthened, which weakened, which purchases became concentrated and which recorded patterns changed. A dealer should be able to examine its own supported purchasing profile and find the product detail behind an apparent change. Neither should need to ask ISZE to prepare a new slide every time the selection changes.

The analytical depth comes from keeping several distinctions visible: value versus quantity where monetary evidence exists; continuing versus newly active references; Genuine versus Best Value Parts (BVP); product form such as element, housing or kit; and the contribution of individual references to a family movement. A validated successor can be shown alongside the original transaction without erasing the code that was actually purchased.

Recorded purchase continuity can be compared with the same account on a compatible period. A clearly defined comparison group can add descriptive context, but it is not the account's required assortment or service potential. A national-only source supports a national Atlas. Quantity-only information supports quantities, composition and recurrence, not fabricated dealer revenue.

The result is a saved commercial selection: the source-defined product range, the observed pattern, alternative explanations, missing evidence and a proposed choice. The user may retain the range, investigate further, prepare a campaign, compare economics or take no action. The useful product is the analytical capability; a support request is not the required ending.

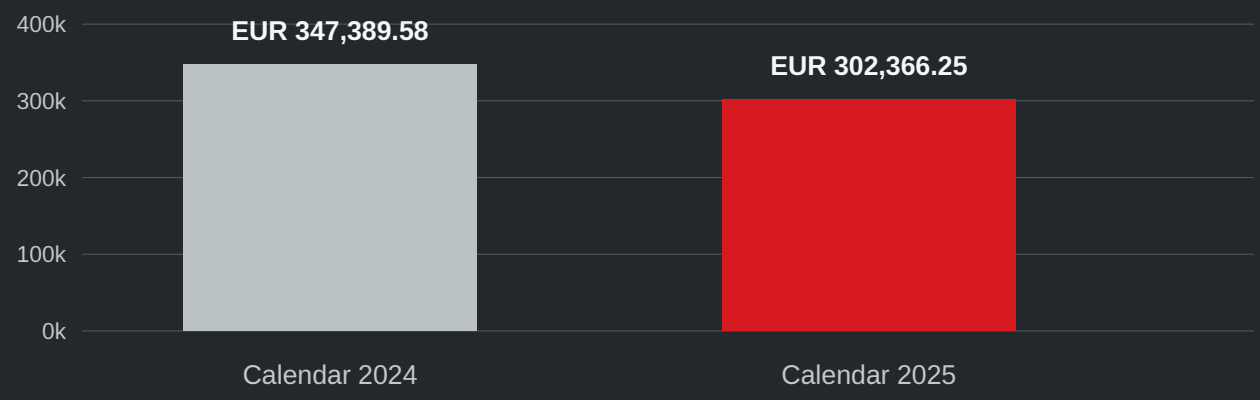

> **A product-level explanation of the business, not another turnover total.**

Retained evidence and rules: U:scope; C:6-12; W:18-19,48-51; E:product design. Detailed product design: proposed [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

An Atlas should concentrate commercial effort.

The ITUK example shows why product-level analysis is more useful than a broad turnover reaction.

ISZE parts billed in EUR. Full-calendar 2024/2025 source-category comparison; source snapshot 19 September 2026. Arithmetic rechecked 22 September 2026. [M; C, pp. 10-12]

EUR 45,023.33 less brake-pad source-category billing was recorded for ITUK in calendar 2025 than in 2024: EUR 302,366.25 versus EUR 347,389.58, a 13.0% reduction. The contextual fleet is 22,389 ITUK trucks on the stated calendar-2025 spend-per-truck basis, using the DVLA March 2026 register. It is not the fleet applicable to every pad reference.

Across the three selected brake-pad, rotor and shoe categories, pads account for 95.7% of the EUR 47,068.77 reduction. These are the supplied categories, not the entire AIM Brakes family. The commercial choice is to concentrate the range investigation, not apply one remedy to all braking products.

The Atlas should make the contributing original references visible and allow a compatible onward-purchasing view where available. Quantity, mix, timing, supersession and coverage remain possible explanations. The observation is not a quantified dealer loss, evidence of price causality or a promise that Universe will recover the reduction.

The tool changes the starting decision: concentrate the analysis before choosing a commercial remedy.

Measured source-category basis: [M]; [C], pp. 7, 10-11. Historical fleet: [N], section 5. Calculations rechecked 22 September 2026; no new operational claim.

PRODUCT / IDS

IDS Development Studio

Turn the self-assessment into a practical development tool.

Isuzu Dealer Standards (IDS) should be a distinctive management tool rather than a questionnaire archive or an action-chasing service. The user explores its actual assessment, sees the meaning behind each section and selects a practical development priority. Suitable comparisons and commercial context add depth without converting self-assessment into proof of business performance.

The first useful output is an understandable assessment profile: actual question wording, response, section, questionnaire version and the available assessment period. Missing, unanswered and inapplicable items remain distinct. An import date must not replace an absent assessment date. The tool should make strengths as visible as weaknesses.

A comparison may show a dealer's position against an appropriate, permitted group only when the questionnaire and scoring basis are compatible. The group and coverage must be explainable, and results must not disclose another participant's identifiable position. There is no distributor audit score and no new universal league table.

The commercial addition is an evidence-based development choice. A user can examine whether a self-reported practice is relevant to a product-range or commercial-planning objective, identify the change it wishes to make, compare effort and intended benefit, and retain the reason for the choice. A cross-source link is a discussion aid, not a causal diagnosis.

Progress has separate meanings. Completing a development initiative shows that the agreed work occurred. A later comparable assessment can show a change in recorded answers or results. A commercial improvement requires its own measurement. None should update the others automatically. The tool therefore remains useful before a second assessment exists, without pretending to measure historical progress.

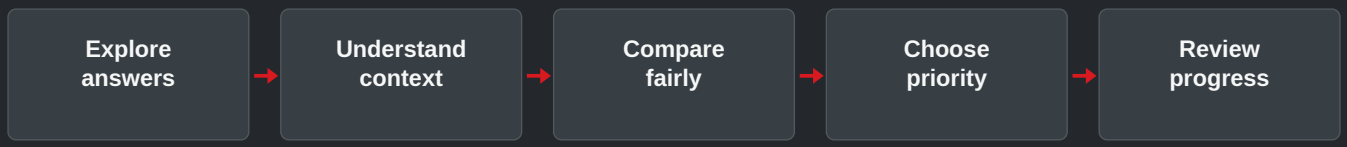

> **A usable view of strengths, priorities and development options.**

Retained evidence and rules: U:scope; W:25-27,48-49; C:6,8; E:product design. Detailed product design: proposed [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Make the assessment useful without inventing performance.

The IDS tool should support a development decision even before a later assessment is available.

Proposed analytical sequence. The arrows do not represent a measured effect.

View	What the user can do	What it does not establish
Own assessment	Read actual section and question results; see strengths and missing information.	Independent audit findings or current status where no date exists.
Suitable comparison	Understand a compatible, permitted peer or own-history comparison.	A league table of business quality or evidence that a practice caused sales.
Development choice	Select a practical improvement, effort and intended result.	A compulsory action generated by a low score.
Later review	Record completion and compare later evidence where compatible.	Automatic score uplift or financial return after completion.

An illustrative use is a dealer principal exploring the parts-management section and choosing whether to develop a range-planning practice. Where an accepted account relationship exists, an Atlas selection can add separately dated commercial context. The combined view should explain relevance, not claim causation.

This is not routine training administration. The capability is a structured understanding of the assessment and a better development choice. The tool does not need fabricated scores, fictional dealer records or a new universal index to demonstrate its intended interaction.

IDS source meaning: [W], pp. 25-27, 48-49; [C], pp. 6, 8. Example and interface design: [E]. No dealer result is fabricated.

PRODUCT / AIM + COMMERCIAL CONTEXT

Range & Campaign Planner

Build a more relevant commercial offer.

The planner takes an analytical selection and turns it into a proposed range or campaign decision. It helps a distributor or dealer examine which products belong in the initiative, which participant or vehicle segment is actually relevant, how the Genuine/BVP offer should be positioned and what would demonstrate that the initiative was useful.

A product is not an opportunity merely because the participant has not bought it. The planner first distinguishes no recorded purchase from a documented range gap, a coverage exclusion, a number change or an irrelevant application. A candidate selection can be retained while those questions remain open; an unsupported sales target cannot.

Genuine and BVP should be assessed together. The commercial task is not to maximise BVP share. It is to develop an appropriate offer and understand the effect on the combined business. A campaign that moves existing customers between Isuzu products is different from one that adds evidenced new activity. Relationships, contents and technical applicability remain explicit.

The proposed output is a campaign brief the participant can use: chosen products, intended audience, rationale, scope, commercial assumptions, resource commitment and evaluation plan. The system should help compare alternatives such as retaining the current offer, targeting a narrower range, changing the product mix or testing a scoped commercial condition.

Execution stays in the existing business. Universe does not become an email-marketing system, order platform or routine quotation desk. It retains the analytical selection and baseline, then evaluates later comparable activity. This connects product insight to business development without importing day-to-day operations into the programme.

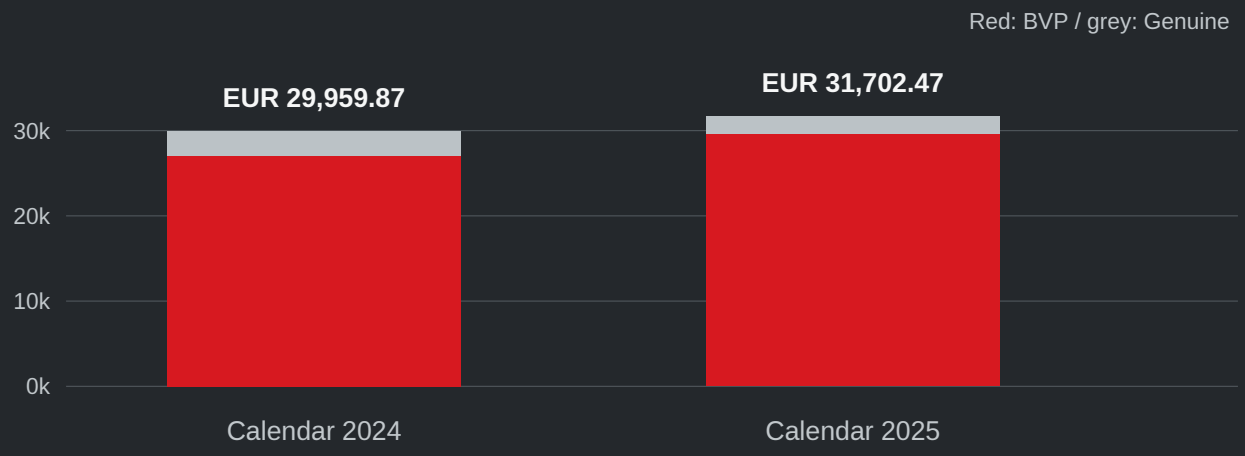

> **A targeted product selection and a testable commercial initiative.**

Retained evidence and rules: U:scope; C:9,12-14; W:24-25,43-44; E:product design. Detailed product design: proposed [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Read Genuine and BVP as one commercial offer.

The Portugal clutch-kit example changes the diagnosis before a campaign is designed.

ISZE parts billed in EUR. Full-calendar 2024/2025 source-category comparison; source snapshot 19 September 2026. Arithmetic rechecked 22 September 2026. [M; C, pp. 10-12]

Combined clutch-kit billing increased by EUR 1,742.60, or 5.8%, from EUR 29,959.87 in calendar 2024 to EUR 31,702.47 in 2025. Genuine billing fell from EUR 2,901.92 to EUR 2,057.86 while BVP rose from EUR 27,057.95 to EUR 29,644.61. The source totals retain their own precision.

The contextual fleet is 8,176 vehicles in Portugal on the supplied calendar-2025 spend-per-truck basis. It is not the applicable population for these clutch kits and is not divided among dealers. The comparison concerns ISZE billing to I Motors, not dealer transactions or individual customer switching.

A Genuine-only view could suggest a recovery campaign. The combined view instead asks how to develop the total offer. The planner should connect original references, contents, applicable product relationships and scenario economics before choosing a campaign. Combined billing growth alone does not establish higher gross profit or competitor business won.

> **A useful range tool can prevent the wrong campaign as well as identify a new one.**

Source-category mix: [M]; [C], pp. 12, 14. Fleet context: [N], section 5. Full calendar years; supplied snapshot 19 September 2026; arithmetic rechecked 22 September 2026.

PRODUCT / AIM + COMPARABLE EVIDENCE

Pricing & Margin Lab

Make the commercial trade-off explicit.

The lab combines supported competitive positioning with user-controlled commercial scenarios. It is a tool for evaluating a selected offer or range, not a service for answering routine quotations. A calculation can be useful before a pricing recommendation is justified, provided the assumptions and evidence status are explicit.

Comparable evidence must establish product and kit contents, application, quantity unit, currency, tax, market, date and commercial level. An online retail observation is not the same as ISZE net distributor terms. Several offers from one seller do not become several independent market confirmations. Unverified comparisons remain candidates, not price instructions.

The confirmed rule in the supplied AIM pricing component defines parts gross profit as revenue less the parts purchase cost of the quantities sold. Freight, duty, overheads, distributor kickbacks and other operating costs are excluded from that particular measure. A separate initiative-economics view can then consider additional costs once, without silently changing the definition of parts gross profit.

Each option uses a stated customer or local-business perspective, effective period, eligible quantity and unchanged-offer baseline. Show revenue and gross-profit changes together. A minimum-margin or permitted-profit-sacrifice policy is an approval control, not an invented input. Missing cost prevents gross-profit output; it does not have to prevent a valid revenue calculation.

The quantity needed to preserve revenue or gross profit is an arithmetic threshold, not a forecast of customer response. A participant may test its own quantities or supported commitments without claiming estimated elasticity. Sensitive downstream selling prices and margins are not mandatory contributions to ISZE: a private calculation can return only a permitted aggregate or no shared financial result.

> **A transparent comparison of revenue, gross profit, margin and required volume.**

Retained evidence and rules: U:scope; A:confirmed rules and objectives; C:13,27-28; E:product design. Detailed product design: proposed [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Show the trade-off, not a magic price.

A transparent scenario is useful without pretending to know how customers will respond.

ILLUSTRATIVE ARITHMETIC / NOT ISUZU PRICES, COSTS OR FORECASTS

Scenario	Unit economics	Quantity to preserve baseline
Unchanged offer	EUR 100 net price; EUR 70 parts cost; EUR 30 parts gross profit; 30.0% margin.	100% of baseline quantity.
Price 5% lower	EUR 95 net price; EUR 70 cost; EUR 25 parts gross profit; 26.3% margin.	105.3% for revenue; 120.0% for parts gross profit.
Price 5% higher	EUR 105 net price; EUR 70 cost; EUR 35 parts gross profit; 33.3% margin.	95.2% for revenue; 85.7% for parts gross profit.

The illustration holds unit cost unchanged. The quantity thresholds are calculated against the same baseline and eligible product. They do not predict demand, justify a discount or show that a price increase will be accepted. At a lower price, revenue can recover before gross profit does; the two objectives should remain visible.

Calculation definition

Revenue = quantity x net unit selling price.
Parts gross profit = revenue - parts purchase cost of quantities sold.
Gross margin = parts gross profit / revenue.
Revenue-preserving quantity = baseline revenue / proposed unit price.
Profit-preserving quantity = baseline parts gross profit / proposed unit gross profit, where a meaningful positive denominator exists.

A changed product basket requires its own mix, not one averaged unit formula. An empty cost is unknown, not zero. A non-positive proposed unit gross profit does not produce an ordinary positive-volume break-even for a profitable baseline. An already loss-making baseline needs separate interpretation.

Baseline illustration: [C], p. 13, 22 September 2026. Parts gross-profit definition: [A], confirmed-rules block. Revenue threshold and presentation: calculated illustration [E].

PRODUCT / PRISM + AIM

PRISM Market Intelligence

Choose where to develop the business.

PRISM contributes the relevant market and fleet context to commercial planning. Combined with the product detail in AIM and source-dated opportunities, it can help a distributor decide where to concentrate range development, fleet engagement or tender effort. It should not become a live vehicle-support service.

The initial view separates measured parts billed, historical vehicles in service and modelled expected demand. Spend per truck is a measured purchasing rate on the stated fleet basis. Target spend and service expectations depend on assumptions and technical applicability. A modelled gap is not automatically recoverable sales or a programme business case.

The product should connect a market segment to a relevant range and to the evidence needed for an offer. A national vehicle total cannot be allocated to dealers by sales, visits or geography. A part that serves several vehicle classes remains shared unless exclusive applicability establishes the attribution. A workshop sample is not a dealer's complete fleet.

For tender intelligence, the useful output is a qualified opportunity shortlist: source and observation date, actual scope, known deadline, relevance to the business and a decision about pursuit. The existing notice source is a reuse candidate. No new tender collector or routine bid-support desk is required by this proposition.

A tender's overall value is not expected Isuzu parts revenue; an award is not parts billed. Tender execution and customer contact remain with the existing distributor and dealer organisation. Universe helps choose the opportunities, connect the relevant product proposition and evaluate what became known. Future service-economics or connected-vehicle tools require a separate source and benefit case.

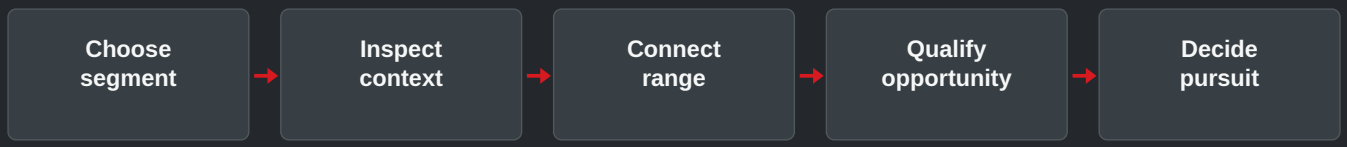

> **A structured market-development choice tied to relevant products and evidence.**

Retained evidence and rules: U:scope; W:28-30,50-51; C:6,15; N:historical fleet and model distinctions; E:product design. Detailed product design: proposed [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Turn market context into a pursuit decision.

Fleet and tender intelligence should help choose the business to develop, not handle the daily bid.

Proposed analytical sequence. The arrows do not represent a measured effect.

The proposed output is a market-development brief. It states the target segment, supported historical fleet or other exposure, relevant product range, source-dated opportunity evidence, known requirements and reason for pursuing or declining. The brief should make clear whether the need is observed, participant-reported or modelled.

Commercial question	Useful tool output
Which segment deserves attention?	A scoped comparison of supported market activity and relevant historical population, with assumptions visible.
What could our offer contain?	A product-range selection linked to the intended application and documented constraints.
Which opportunities merit effort?	A sourced shortlist with relevance, known deadlines, requirements and explicit missing information.
What did the pursuit achieve?	Separate records of pursuit, award and supported subsequent activity; no automatic revenue attribution.

Actual customer contact, quotation production, technical approval, supply confirmation and tender submission remain in existing processes. Universe does not promise live availability or create new delivery obligations. It can retain a reference to an authorised decision when that helps evaluate the initiative.

A relevant, well-qualified shortlist is more valuable than a large count of notices with invented commercial value.

Retained market, fleet and tender boundaries: [W], pp. 28-30, 50-51; [C], p. 15; [R], p. 9. Product-first planning journey: [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Deep analysis should change the choice.

Adding detail is useful only when it helps discriminate between commercially different explanations.

Observed pattern	Useful additional analysis	Decision consequence
A category declines	Original references, product forms, compatible quantity and value changes.	Concentrate the range study rather than apply a broad remedy.
An old reference stops	Documented successors and unchanged original transaction history.	Distinguish number migration from a disappearing business.
Genuine falls; BVP rises	Combined offer, contents and eligible economics.	Review total contribution instead of assuming loss.
One account differs	Coverage, surrounding range and appropriate comparison scope.	Distinguish an account-specific pattern from a national issue.
An IDS topic seems relevant	Actual wording, source period and validated relationship.	Use it as a development prompt, not a causal verdict.
A campaign is followed by growth	Comparable baseline, selection, timing, mix and other interventions.	Report what changed before attributing the result.

A missing source is a limitation, not an explanation. Upstream billing minus sales to dealer is not an inventory movement without the necessary coverage and stock evidence. A repeated purchasing interruption can be investigated, but it should not become a claim that the dealer failed to maintain vehicles.

The tools should allow a commercially important observation to remain visible without turning it into an unsupported opportunity amount. Quantified opportunity claims still need a euro basis, the product or service category and relevant fleet or exposure. Where those are unavailable, publish a descriptive observation and its limits.

Interpretation rules: [W], pp. 49-51; [N]; [R], pp. 4-6, 10-11. Revised decision framework: [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Keep the commercial initiative together.

A selected business choice needs continuity; it does not need to become a support ticket.

A common initiative record connects analysis, the chosen alternative and later evaluation. It is appropriate for a range campaign, pricing study, IDS development plan or market-development pursuit. It is optional for ordinary exploration: a user can obtain a useful analytical answer without opening a record.

Retain	Why it matters
Purpose and beneficiary	Names the commercial decision and who should gain, rather than assuming ISZE gain is participant value.
Selected entity, period and product scope	Keeps the national or account analysis consistent across tools.
Evidence and alternatives	Preserves observations, assumptions, rejected options and unresolved conditions.
Chosen initiative and business owner	Records what the organisation decided, not a system-generated approval.
Baseline and review basis	Makes later evaluation possible without changing the comparison after the result is known.
Known result and reusable learning	Separates implementation, observed movement and attributed commercial benefit.

Existing operational references may be linked where permitted, but Universe does not become their authority. A price proposal does not change a price list. A range initiative does not place an order. A completed IDS improvement does not rewrite the assessment. An observed sales change does not automatically create incremental profit.

> **The centre is the commercial choice. The record exists to preserve the reasoning and learning, not to administer every dealer interaction.**

Context and source continuity retained from [W], pp. 48-49, 64-68; [R], pp. 4, 7. Initiative-first scope replaces support-ticket emphasis under [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Reuse the minimum information already supplied.

The recurring commercial exchange remains price-free and explicit about coverage.

Information	Minimum usable meaning
Distributor and account	Stable commercial-entity identity; original purchasing account where supplied; validated relationships. National information stays national.
Original part	Transacted identity as text. Classification, successor and candidate BVP relationships are additional records.
Period, quantity and unit	Actual transaction or reporting meaning; calendar or fiscal basis; documented returns and correction treatment.
Coverage	Included accounts, channels, products and events; wholesale inclusion; missing or provisional periods.
Version and control	Source date, version replaced, compatible control totals and a responsible source contact.

Monthly review is a proposed operating cadence, not a new contractual deadline. The existing reporting arrangement determines its agreed scope. The owner's rebate clarification does not independently establish every field, deadline or eligibility condition.

Selling prices, resale margins, customer identities, vehicle identifiers, full inventory and workshop job cards are not silently added to the recurring requirement. Quantity-only data can support valuable analysis without becoming downstream revenue. Already supplied definitions should be reused instead of repeatedly requested.

A corrected submission replaces its declared predecessor for the affected scope. Identical re-imports add no activity. Annual controls are not added to monthly observations, and national controls are not added to their dealer detail. Combined accounts stay combined unless the source genuinely supports a split.

Proposed source standard: [C], p. 21; [W], pp. 62-64; [R], p. 4. Tool-first use and current scope: [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Earn optional depth through a better tool.

Every additional contribution must make a specific analytical capability more useful.

Tool	Smallest additional contribution	Useful return
Commercial Atlas	A scoped identity or classification correction, or additional compatible history.	More accurate own-business analysis or a valid later-period comparison.
IDS Development	Chosen priority and completion evidence; later compatible assessment when it exists.	A retained development plan and an honest view of progress.
Range & Campaigns	Eligible products, target population and campaign period.	A reproducible initiative baseline and later evaluation.
Pricing & Margin	A restricted comparable reference or private scenario inputs.	A better-supported comparison or local economic calculation.
Market Intelligence	A defined aggregate population or an opportunity relevance/outcome statement.	A scoped market study or a more useful future shortlist.

The request should explain purpose, audience, expected output and the narrower capability available without it. A participant can decline unrelated optional information without losing other valid analysis or ordinary support. Providing one selected observation does not authorise a permanent connection to the entire operational system.

Private financial inputs should stay private unless an explicit sharing purpose is agreed and technically enforced. A locally calculated aggregate can be sufficient for evaluation. No application label, hidden field or browser filter proves that sensitive information has been protected.

> **Measure better decisions per unit of effort, not the number of fields collected.**

Optional-exchange and privacy-by-scope design retained from [C], pp. 21-22, 25; [W], pp. 34-36, 68-69. Revised tool-specific returns: [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Participation must be earned through use.

The first invitation should open a relevant capability, not an empty form or a queue of requests.

Begin with a prepared view at the participant's actual data level. Let the user inspect the evidence, change a selection, compare an option and retain an output. Observe whether the capability helps the real decision rather than requiring the user to confirm that a demonstration looks attractive.

Preparation effort and user benefit may fall on different people. The recurring source owner needs accepted definitions and a clear correction process. A manager needs a commercially meaningful output. The participant deciding on further sharing needs to understand its purpose and limits. All three matter to continued cooperation.

Additional dealer enablement, where separately approved, should remove a specific setup or practical-use obstacle. It should not reward uploaded rows, more sensitive disclosures, inflated assessment scores or unverified sales claims. The existing distributor rebate should not become a second payment for the same submission.

Recognition can acknowledge a useful improvement, correction or transferable practice. It is not the product and should not become a public turnover league table. Participation is not measured by daily logins: the relevant question is whether the user returns when another eligible commercial decision occurs.

> **A user who produces a better range or development choice without contacting ISZE has used Universe successfully.**

Onboarding, enablement and recognition principles: [C], pp. 18-20; [W], pp. 32-35, 43-44. Self-directed tool success: revised proposal [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

ITUK: prove the value of account-level analysis.

The pilot should test a commercial tool with the data it actually supports, not demonstrate a fictional dealer business.

The supplied calendar-2025 ITUK material includes named purchasing-account information. It supports within-year analysis on covered records. It does not establish a second comparable named-dealer year, a dealer fleet or a validated link from every purchasing account to an IDS assessment. National and dealer totals remain separate.

Proposed participant task

An authorised distributor user opens the Commercial Atlas, selects a supported account and product range, examines the original references behind a pattern and compares appropriate within-year context. The user retains a commercial selection, rejects an inappropriate remedy or prepares a range-development option. The test is whether the Atlas makes that choice clearer than the existing review.

What could be shown to a dealer

A correctly scoped own-account view can support a distributor-led commercial discussion or authorised direct exploration. The dealer can inspect its own evidence and choose a relevant business use. It is not given a national fleet share, another dealer's identifiable results or an invented estimate of spend lost to competitors.

Evidence required to continue

Record the actual task, source basis, user's selected output, decision made or changed, total effort and limitations. Observe a genuinely later eligible use before claiming repeat participation. A corrected input can demonstrate correction logic, but a test file cannot prove a recurring distributor submission.

> **ITUK tests whether detailed own-account product analysis gives its users a commercial capability they value.**

Pilot source scope: [C], pp. 8, 37; [W], pp. 54-57. Revised analytical pilot task: [U; E]. No participant invitation or access acceptance is implied.

COMMERCIAL TOOLS / PROPOSED PRODUCT

Portugal: useful without invented dealer detail.

I Motors should receive a national commercial tool and an independently useful IDS tool.

The supplied Portugal sales-to-dealer information is national part-by-period data, not purchasing attributed to named dealers. The available dealer self-assessment information is a different source. One must not be allocated from the other or combined simply because both are Portuguese.

Proposed national commercial task

The I Motors team uses the Commercial Atlas and Range & Campaign Planner to review the combined Genuine/BVP offer in a selected range. It identifies a candidate initiative, retains the contributing references and compares whether the existing offer should be kept, narrowed or developed. The historical clutch-kit example demonstrates why the combined offer matters; it does not prove a campaign opportunity.

Proposed dealer-development task

An authorised dealer user explores its actual IDS self-assessment and chooses a development priority. The recorded wording, version and available period remain visible. A suitable comparison requires its own compatible basis. This capability can be useful without an account-level purchasing link, and it must not pretend that national purchasing explains that dealer's assessment.

Evidence required to continue

Evaluate the national range decision and the dealer assessment task separately. Record correct use, the output the participant found useful, effort and any later relevant reuse. A successful Portugal task does not validate ITUK-style account joins, and a successful ITUK task does not create Portuguese dealer data.

> **Common tool logic does not require identical source depth. Useful national analysis is better than fabricated personalisation.**

Pilot distinction: [C], pp. 8, 12, 37; [W], pp. 54, 57. Revised task design: [U; E]. Missing assessment dates remain missing; no score is reconstructed.

COMMERCIAL TOOLS / PROPOSED PRODUCT

Preserve the foundations. Change the proposition.

The scope correction affects the narrative and product organisation more than the validity of the underlying analytical ingredients.

Existing material	Treatment in this edition
AIM product structure and analysis	Retain original identities, selected classification and supported deep analysis. Do not recreate an independent numerical truth.
IDS assessment and PRISM context	Retain their distinct source meanings. Reframe the user-facing products around development and market choices.
2.0 interactive map and navigation	Reuse the explorable overview and relationship mechanics. Replace the service-led centre, examples and journeys.
Routine service blueprints and case states	Remove from the product offer. Keep only continuity needed for a commercial initiative.
Earlier delivery priorities and budgets	Review against the new scope. Prior proposals are not validated cost estimates for this edition.
Existing analytical evidence	Keep the actual source period and limits. Do not turn an attractive new interface into evidence of production readiness.

The available evidence includes the earlier explanatory HTML and the supplied pricing component, papers and derived summaries. This rewrite does not inspect or certify every production Atlas or IDS implementation. No percentage of reusable code, live integration claim or implementation-effort estimate is inferred from the presence of the files.

The earlier PowerPoint is not available among the accessible files for this rewrite. The companion deck is a newly authored replacement based on this paper and the AIM visual treatment documented in the commercial revision, not a claimed slide-by-slide edit of an unseen deck.

Supplied artefacts and [R], pp. 3, 16; current file inspection 22 September 2026. Scope treatment: [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Evaluate commercial usefulness, not support activity.

The programme succeeds when a participant gains a better capability and can show the decision it enabled.

Evaluation question	Evidence to retain
Did the tool support a real decision?	The selected business problem, analytical output and actual choice, including justified no action.
Was the analysis correct?	Source/period reconciliation, scope and relationship checks, and the limitations the user understood.
Was it worth the effort?	Comparable preparation, correction, exploration, decision and evaluation effort, not just time on screen.
Did the participant benefit?	Beneficiary-confirmed usefulness and any measured financial or operational result on its stated basis.
Was information improved voluntarily?	A relevant correction or contribution that materially improved the tool's output.
Did useful use repeat?	A later eligible decision or compatible source cycle; reasons for non-use kept separate from lack of need.

Support-ticket counts, time to an availability reply and routine quotation closure do not demonstrate Universe value because those activities are outside scope. Upload counts and logins are activity measures, not commercial outcomes. The revised evaluation should compare the same real analytical task before and after the tool is used.

A later purchasing increase is an observation. Attributing it to a campaign or tool requires an appropriate evaluation design and consideration of timing, product mix, supply, other interventions and changing coverage. Do not choose the comparison after seeing a favourable result.

> **Correct self-service analysis is a legitimate outcome. Commercial return remains a separate, evidence-based claim.**

Evaluation principles: [W], pp. 43-44, 66-68; [C], p. 39. Tool-specific success criteria replace response-service measures under [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Keep the economic mechanisms separate.

Potential benefit is not a programme return until its beneficiary, baseline and evidence are established.

Possible benefits include better range choices, avoided unnecessary concessions, more focused commercial effort, improved campaign selection and additional contribution where evidenced. These mechanisms justify testing the tools. They do not justify applying an arbitrary recovery percentage to a modelled market-spend gap.

Measure	Calculation or evidence boundary
Parts gross profit	Revenue less parts purchase cost for the quantities sold, using the confirmed AIM definition and aligned effective basis.
Initiative contribution	Relevant gross-profit change, then additional support and operating costs not already included; identify displacement and other interventions.
Participant purchase-cost difference	A supported difference in net purchase cost on eligible quantities; not automatically downstream gross profit.
Capacity released	Comparable old total effort less new total effort, including correction and evaluation; not automatically cash saved.
Programme cost	Actual external expenditure plus relevant internal effort and continuing operation; no zero-cost assumption for internal work.

Do not count the same gain across Atlas, campaign and pricing products. Attribute a result to the initiative and beneficiary, then describe which tools contributed. A financial transfer between participants is not automatically additional network profit. Unknown financial results remain unknown, even when the tool was useful.

No realised Universe return, approved revised budget or forecast of incremental sales is established by this edition.

Economic boundaries: [A], confirmed rules; [C], pp. 27-28, 35; [W], pp. 36-39, 66-68. Revised evaluation use: [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Reassess funding against the corrected product.

The earlier envelopes remain planning references, not a costed recommendation for the new scope.

The 22 September 2026 commercial revision proposed alternative first-12-month additional external cash ceilings of **EUR 0, EUR 100,000 and EUR 300,000**, excluding recoverable value-added tax (VAT). They are alternative totals, not cumulative budgets, supplier quotations or approved expenditure. Internal time, existing licences and later operating costs remain separate.

Earlier proposed allocation	EUR 100,000 route	EUR 300,000 route
Dealer enablement	15,000	100,000
Onboarding, training and launch	10,000	35,000
Targeted specialist engineering	25,000	50,000
Mapping, validation and quality	15,000	35,000
Hosting, tools, monitoring and backup	5,000	15,000
Independent assurance	10,000	15,000
Evaluation and recognition	5,000	15,000
Contingency and unreleased reserve	15,000	35,000
Total external ceiling	100,000	300,000

The allocations are reproduced without reallocation for traceability. The new scope requires accepted deliverables and quotations where appropriate: product-specific analytical usability, approved source relationships, controlled participant outputs, repeatability and evaluation. No allocation is now justified by implementing routine support or a new help desk.

The owner-led route remains possible within genuinely available authorised capacity. A larger envelope may improve enablement and resilience, but it does not prove wider adoption or production readiness. Unneeded work and reserves remain unspent. Prior staged releases must be reconsidered against the revised deliverables rather than treated as automatic approvals.

Amounts and horizon: [C], pp. 29-31, 36-38; [R], p. 12, all dated 22 September 2026. Scope reassessment and funding caution: [U; E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Deliver commercial capability in manageable steps.

The sequence should prove usefulness before broadening the product or participant population.

Stage	Participant or business result	Evidence to move on
Agree the revised product scope	A clear portfolio and explicit exclusion of routine services.	The paper, presentation and showcase explain the same proposition.
Inspect and retain existing work	An identified usable Atlas or IDS capability.	Reproduce the selected output; identify source, code, usability and access limits.
Complete a bounded analytical task	A participant can explore, compare and retain a useful output.	Correct task completion and a named commercial decision, not a rendered screen alone.
Validate controlled use	The intended recipient receives only permitted information.	Independent content/access review on the actual selected route.
Repeat and evaluate	The next eligible use retains context and handles corrections.	Real later evidence, effort and usefulness; recovery by an authorised second person.
Extend the proven product	A justified new source, user context or analytical function.	A stated benefit and accepted cost, source, ownership and evaluation basis.

No elapsed-week estimate from the earlier support-centred roadmap is inherited as a promise. Planning follows inspection of the current implementation and the selected scope. A controlled distributor-led analytical output can test usefulness before wider portal functionality is justified; that does not certify a multi-user system.

Reuse useful components. Do not commission a new data platform or rebuild the existing analytical estate to make the presentation look unified.

Reuse and staged acceptance: [R], pp. 3, 13-16; [W], pp. 53-54. Revised deliverables and sequence: [U; E], not an approved schedule.

COMMERCIAL TOOLS / PROPOSED PRODUCT

Make the boundaries part of the tools.

A participant should be able to understand what an output means and what it cannot establish.

Boundary	Required behaviour
Entity and population	Keep ITUK separate from IUK, and UMI separate from UTI. No UTI contribution to the 2026 IDS population.
Period and sales stage	Billing reference ends 30 June 2026; 2026 is a half year. Compare compatible periods and never add upstream billing to downstream sales.
Fleet and applicability	Historical fleet only on its stated basis. No invented dealer allocation or apportionment of shared-applicability purchases.
Assessment meaning	Actual self-assessment, source version and available period. No distributor audit score or invented response.
Monetary meaning	Quantity-only records are not revenue; reference valuations and modelled expectations remain labelled. Restricted totals stay restricted.
Access and exports	Permitted content must be enforced in the real implementation. Hidden menus and filters are not data separation.
Correction and recovery	Preserve prior evidence, declare restatements and demonstrate restoration. A backup message is not a recovery test.

The product rules do not constitute a legal determination or deployment approval. Source-specific information uses and participant access need the responsible review. The showcase is explanatory and contains no live identity or transaction connection.

The old PRISM reference provides an interaction pattern, not authority for its historical totals, forward projections or live-status labels. Those claims are not imported into the revised product story.

Standing context: [N]; [W], pp. 44-51, 68-71; [R], pp. 4, 8, 10-11. Presentation-only treatment of [P] under [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Extend the analytical advantage, not the help desk.

Future tools should earn their place through a useful decision, appropriate evidence and manageable effort.

Product-range association studies

An optional extension could explore which product combinations recur in supported purchasing populations and help users design a more relevant commercial selection. Co-purchase is not proof that parts belong on the same repair or are technically interchangeable. A job-level claim would need appropriate job and application evidence.

Seasonal range planning

With sufficient comparable history, a tool could distinguish recurring seasonal patterns from one-off orders and compare the timing of proposed campaigns. Purchasing history alone does not authorise stock replenishment instructions or a demand forecast. The first useful output could be a planning comparison rather than an automated recommendation.

Fleet economics for a defined population

A later commercial study could test a service offer for a verified vehicle population using an applicable technical basis and explicit cost assumptions. It must not infer the population from a part, turn a workshop sample into a territory or reuse an unsupported fleet forecast.

Artificial intelligence as assistance

An optional assistant can help find evidence, navigate the classification, summarise a selected analysis or draft an initiative explanation. Deterministic calculations and permissions remain outside generated prose. The user must retain a non-chat route to the tools. No chatbot, autonomous action or new paid coding platform is a condition of the first useful product.

These are candidate analytical extensions. No operational readiness, forecast accuracy or participant demand is asserted.

AI and future-service boundaries: [W], pp. 51-52, 58-59. Candidate analytical extensions and evaluation requirement: new proposals [E].

COMMERCIAL TOOLS / PROPOSED PRODUCT

Acceptance is a business test as well as a technical test.

The revised proof must show a useful tool, a safe output and a commercially meaningful choice.

Acceptance area	What must be demonstrated
Tool value	A real user completes a selected analytical task and identifies the decision or useful output it enabled.
Source integrity	Entity, period, unit, coverage and original references reconcile; missing information is not zero.
Distinct evidence	Observed purchasing, self-assessment, technical relationships and modelled context remain distinguishable.
Scenario arithmetic	Both revenue and gross-profit outcomes are checked; missing inputs and non-positive margins are handled honestly.
Participant boundary	No routine service is made conditional on contribution. Optional information affects only dependent analysis.
Controlled output	Actual exports and access are inspected for the intended audience; the interface is not treated as a security control.
Repeatability	A real later use, correction and recovery preserve the accepted scope and historical basis.

At the agreed pilot review, continue only where the capability is correct and useful enough to justify its effort. Narrow or stop an extension that repeatedly fails to support a meaningful decision, cannot protect participant information or requires disproportionate work. Do not expand solely because the interface is complete.

The decision requested is approval of the corrected product direction and selection of bounded analytical tasks for evaluation. It is not a request to approve every tool, all earlier budget lines or a network-wide rollout. Technical acceptance, source acceptance, participant usefulness and financial return remain separate.

> **The business case must survive the removal of routine support. The tools themselves must be worth having.**

Acceptance foundations: [R], pp. 10-11, 15-16; [W], pp. 69-71. Revised tool-first acceptance and stop/narrow logic: [U; E]. Tests listed here are requirements, not recorded passes.

APPENDIX / SOURCE AND EDITORIAL RECORD

Sources and revision record.

This edition deliberately changes the product framing while preserving the relevant evidence boundaries.

[U] Business-owner clarification, 22 September 2026. The controlling scope instruction: distinctive commercial tools, with ordinary availability, BVP/application information and day-to-day support outside the programme.

[C] Commercial and participation revision, 22 September 2026. Retained for participation history, category examples, funding alternatives and documented AIM styling. Its routine-support service portfolio is replaced. **[W] White Paper 1.1 revised, 21 September 2026.** Retained for analytical, participation, source and access distinctions, not its support-ticket-centred proposition.

[R] Implementation Roadmap, 22 September 2026. Retained for reuse and acceptance principles. Support-centred task ordering and time estimates require reassessment. **[Y] Yellow Paper 0.5, 22 September 2026.** Used for challenge discipline and source-definition caveats, not as a replacement numerical authority.

[M] Supplied Genuine/BVP category summary, snapshot 19 September 2026. Selected full-calendar 2024/2025 ITUK and Portugal comparisons were rechecked arithmetically for this rewrite. **[N] ISZE numerical reference, 19 September 2026.** Historical fleet basis and billing horizon. **[D] Sales-to-dealer evidence.** Pilot source depth as documented in the supplied records and commercial revision; no new dealer population is fabricated.

[A] AIM Pricing Decisions 0.3, 22 September 2026. Its confirmed-rules block supplies the parts purchase-cost definition and scenario-objective distinctions. **[P] PRISM showcase, labelled 17 July 2026.** Interaction reference only. **[E] New proposals in this Commercial Tools Edition.** Tool portfolio, journeys, participant outputs and revised proof design; not operational facts.

Design and companion files

AIM styling is documented in [C], p. 46: dark charcoal #24282C, Isuzu red #D71920, white/light grey and Arial. This PDF uses metrically compatible Arimo where Arial is unavailable; the presentation specifies Arial and the HTML uses an Arial-first stack. No font files, raw billing or full price lists accompany the outputs.

The companion management presentation is newly authored because the original deck was not accessible. The HTML revises the supplied 2.0 explanatory showcase. These artefacts supersede the earlier product narrative for this review; they do not change authoritative systems, financial approvals, contractual terms or accepted production software.

Prepared 22 September 2026. No external research or new current-market claim is introduced by this source-based rewrite. All unmeasured tool benefits remain hypotheses to evaluate.
