ISZE PARTS EUROPE · WHITE PAPER

Isuzu Universe

Tools that distributors and dealers want to use, in exchange for the information that makes those tools better.

Isuzu Truck UK brake pads, 2024 to 2025. Value fell 13.0%, units fell 25.4%. A revenue view suggests a demand problem, a volume view suggests a price problem. Only product detail shows where to act, and that is what Universe gives a distributor.

- What Universe is, and the routine service it deliberately leaves out
- What dealers and distributors receive, and what they are asked for
- How a Deal of the Day is funded, and what it has to earn
- What to build first, and the condition under which it stops

Prepared by **Jérôme Van der Pluym**, VP Sales, ISZE

23 September 2026

The paper on one page

What Universe is. A programme that gives distributors and dealers tools worth opening and, in return, earns the parts and aftersales information that makes the next answer sharper. The tools are the offer. The exchange is the point.

Why now. ISZE has asked its distributors for information for years without returning enough visible value to keep the request alive. A reporting obligation can start an exchange; only a useful tool keeps it going. The 2025 arrangement that tied a share of the normal distributor rebate to a performance submission is the floor, not the mechanism.

What it is not. Availability questions, part and Best Value lookups, day-to-day quotation handling and support administration stay in the existing business. They are not modules of Universe, not rewards for taking part, and not bargaining chips for more data.

Three decisions for this month

Decision	Recommendation	What has to be true first
1. Fund Deal of the Day	A named line of €60,000 to €90,000 inside the existing €100,000 route. A Deal of the Day qualifies only above €150,000 of eligible billing.	The selection rule is agreed and the first eligible Deal of the Day is named.
2. Approach ten dealers	Through their distributor, arriving with a finished review of the dealer's own business and asking for a correction, not for data.	A prepared review exists from information ISZE already holds.
3. Build two tools first	The Parts Atlas and the Dealer Standards Studio.	The parts classification is fixed to one named release.

€32.4M

parts billed to 22 distributors in 2025, the base every envelope is measured against

0.31%

the €100,000 route as a share of that base: the right size for a pilot

40

beneficial actions at €2,500 each are needed to earn back €100,000

0

outcomes recorded for Don't Lose the Deal or for public tenders

> **One decision closes two gaps.** Don't Lose the Deal and the tender feed can both qualify and support a deal, and neither can show that it won anything, because nobody writes the outcome down. Agree to record one line per closed case.

Still open. Nobody has yet been named to answer a distributor's or a dealer's question once the tools raise one, and the money depends on that. Whether participation should carry a score is also still to be decided (chapter 5).

What this paper does not claim. No realised return, no approved budget, no forecast of extra sales. No participant has accepted anything. Where money is discussed, the paper states the hurdle, not a predicted outcome.

How to read the evidence. Every substantive statement carries one of three labels. MEASURED is counted in ISZE's own records. INFERRED is a conclusion drawn from measured data. PROPOSED is a design or decision not yet taken. Where something is unknown, the paper says so and does not fill the gap with an assumption. Illustrative arithmetic is labelled as such and is never a forecast.

CHAPTER 01

Deal of the Day

€500

of gross profit turns on one choice: give the discount on the extra units, not on all of them.

01

What a Deal of the Day is

Which units get the discount

The size floor

Where concession already sits

A candidate for the pilot

Why thresholds, not forecasts

The funding line

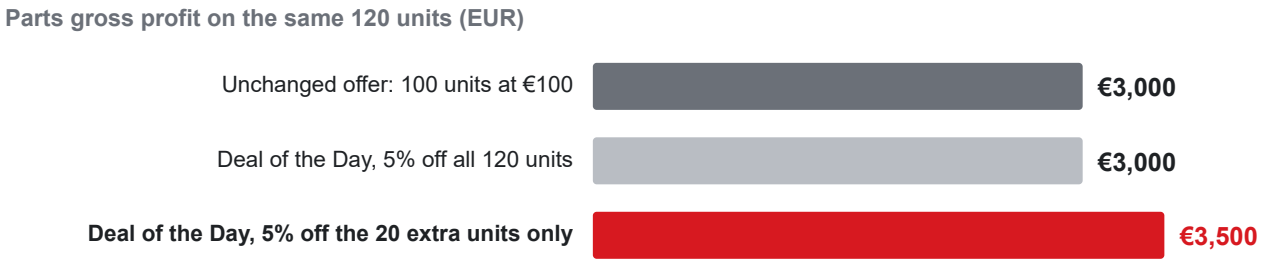

1.1 What a Deal of the Day is

ISZE helps a distributor prepare a specific, time-limited commercial offer: a reasoned product selection, the right audience, transparent economics, and a way to learn from what follows. The value is in the preparation behind the offer, not in the discount.

It is the most concrete thing Universe does, and the one a distributor's parts manager understands in thirty seconds. That is why it opens this paper. It is also the one that spends money, so it has to be designed so that the money buys evidence.

Not to be confused with Don't Lose the Deal (chapter 4), which is Isuzu Truck UK's existing support for competitive quotations. The initials are the same and the products are different.

1.2 Which units get the discount

The same 120 units, two ways of paying for them. Illustrative arithmetic: 100-unit baseline at €100 net and €70 parts cost, 20 extra units, 5% concession. Not an Isuzu price, offer or forecast.

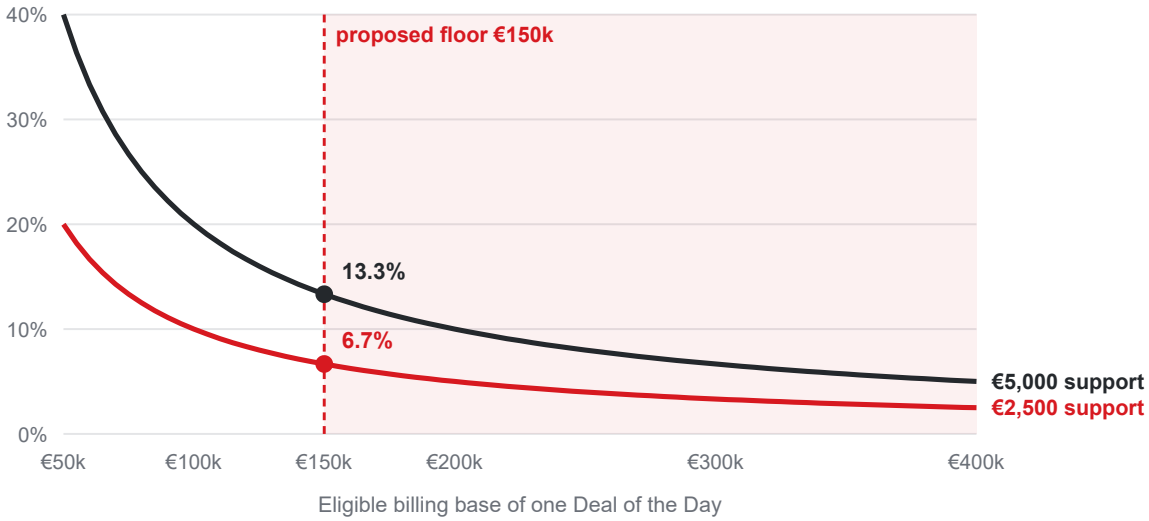

ILLUSTRATIVE A distributor sells 100 units a period at €100 net, with €70 of parts cost: €3,000 of gross profit. A Deal of the Day lifts volume to 120 units at a 5% concession. If every unit gets the discount, gross profit stays at €3,000, so the 20 extra units have bought nothing. If only the 20 extra units get the discount and the baseline keeps its normal price, gross profit is €3,500. The €500 difference comes from the scope of the concession alone and assumes no change in demand.

Mechanism	Adds by construction?	Verdict
Concession on extra volume only, against a documented baseline	Yes	**Test first**
Fixed contribution per Deal of the Day	No	Test
Concession on all volume, baseline included	No. It costs five times as much on the same volume	Not as standard
Payment per record or data field submitted	No. It rewards disclosure, not decisions	Do not use
Prize for the largest sales total	No. Business sizes cannot be compared	Do not use

1.3 The size floor

A Deal of the Day costs preparation and support whether it is large or small. With the same illustrative economics (a 30% gross margin and a 5% concession on the extra units, so 25 cents of gross profit on every extra euro sold), the chart shows how much extra business one Deal of the Day has to produce just to pay back its own support.

Extra sales needed to pay back the support, as % of the eligible billing base

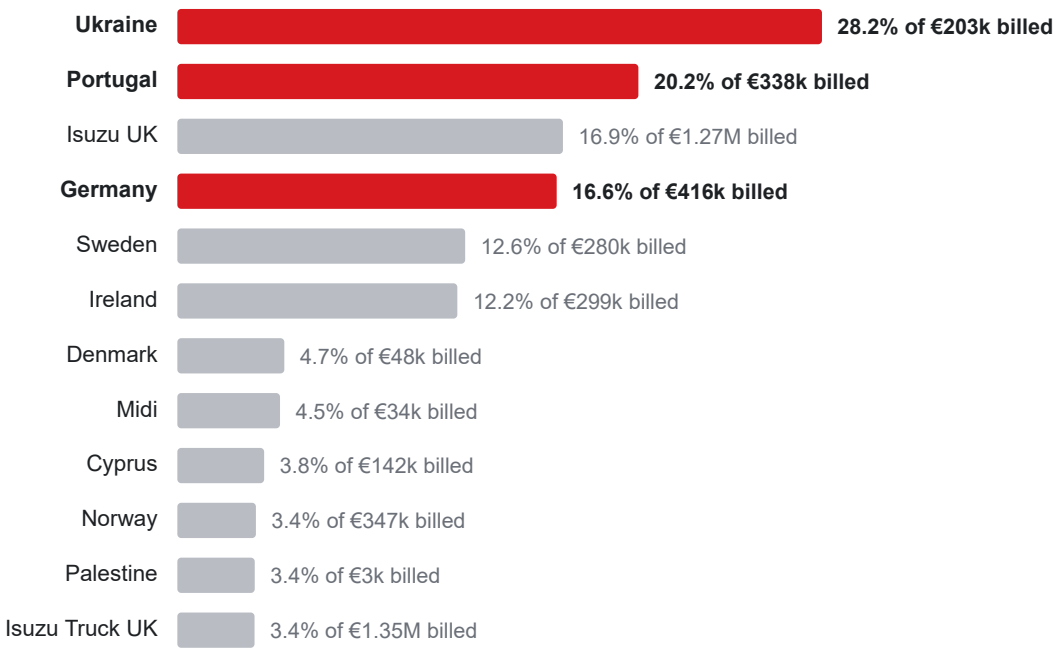

Small Deals of the Day cannot pay for themselves. Illustrative arithmetic: extra sales × 25% gross profit = support cost. Not a forecast of response.

At €150,000 of eligible billing, €2,500 of support needs 6.7% extra sales and €5,000 needs 13.3%. At €50,000 the same support needs 20% and 40%, which no discount of this size should be expected to deliver. PROPOSED A Deal of the Day qualifies for support only above **€150,000 of eligible billing**.

1.4 Where concession already sits

MEASURED Maintenance parts (PMS) billed €6.65M across 24 distributors in 2025 on lines carrying a reference price. Of that, 8.4% (€558,851) was billed at least 20% under the reference price and 2.8% at least 30% under. In 2024 the same shares were 13.0% and 4.0% of €7.11M. The fall is real and favourable.

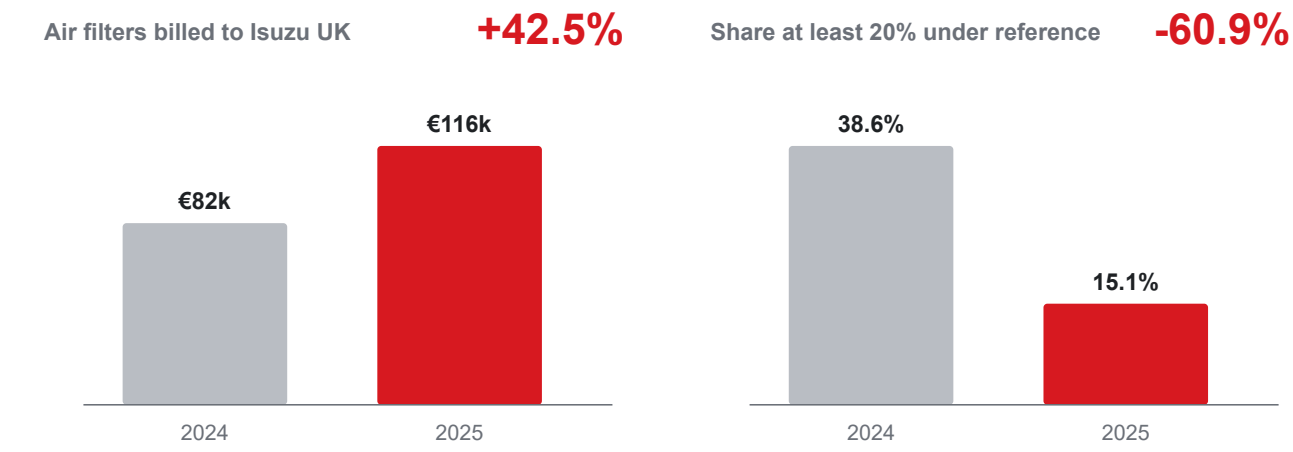

Share of 2025 maintenance-parts billing at least 20% under the reference price

The deepest concession is not in the largest markets. ISZE billing of maintenance parts with a reference price, calendar 2025. Red: under €500k billed and at least 15% deep-discounted. The twelve highest shares of 24 distributors are shown.

INFERRED Ukraine, Portugal and Germany carry high deep-discount shares on modest billed bases. A support programme without a size floor would spend most of its money in the smallest markets, because that is where the share is highest. The data argues for the floor; caution alone would not.

1.5 A candidate for the pilot: Isuzu UK air filters

A line whose concession is already moving. ISZE billing of air filters to Isuzu UK, calendar 2024 and 2025, lines with a reference price.

MEASURED Air filters billed to Isuzu UK rose from €82k in 2024 to €116k in 2025, while the share billed at least 20% under the reference price fell from 38.6% to 15.1%. This line already has a measured concession history, at a distributor where account-level detail exists. It is the right place to test whether a prepared Deal of the Day adds anything a concession alone does not.

PROPOSED On its own, at €116k, the line sits below the €150,000 floor. It qualifies as part of a wider filter selection for the same distributor (Isuzu UK filters together billed €406k in 2025), or if the floor is set lower. That choice belongs to the funding decision. Nothing has been agreed with the distributor.

1.6 Why thresholds, not forecasts

MEASURED ISZE has measured how distributor purchasing responded to list-price moves between 2024 and 2025. For maintenance-service parts the response is negative, but the uncertainty is half the size of the estimate and it explains less than 1% of the movement. For brakes it is flat to slightly positive, with an uncertainty three times the size of the estimate. For lubrication it cannot be measured at all, because the price moved almost uniformly. Of the brakes change, roughly €233k sits where price rose and volume fell, €172k where both rose, and €335k where volume fell with price flat. This is ISZE-to-distributor purchasing, not dealer demand, and demand shocks are not controlled for. The evidence is too weak to forecast from, which is why every Deal of the Day in this paper is judged against a threshold: what would have to happen, not what will.

1.7 The funding line

Line	Proposed	Basis	What has to be demonstrated
Deal of the Day support	**€35,000 to €50,000**	8 to 12 Deals of the Day at €2,500 to €5,000 each, all above the size floor	Qualifying Deals of the Day exist; contribution is measured on the same scope before and after
Dealer enablement	**€15,000 to €25,000**	25 to 40 accepted setup tasks at €600	A documented task, an accepted deliverable, and later use
Independent evaluation	**€10,000 to €15,000**	Two waves, at 90 and 180 days, including returns	The result is published whether it is favourable or not
Total cash	**€60,000 to €90,000**	Inside the existing €100,000 route, without touching the engineering or assurance lines	—
Internal preparation	**Not costed here**	Shown as internal time, not assumed free	A named owner and a stated allocation

Name the line. The current position, that Deal of the Day support needs its own approved commercial treatment and is not automatically funded from an enablement allocation, is a control, not an answer. This paper asks for the line to be named.

What it must earn. At €2,500 of contribution per beneficial action, €60,000 to €90,000 needs 24 to 36 qualifying actions before internal costs. A pilot of ten Deals of the Day proves the method, not the return. What it delivers is the first real measurement of how often a Deal of the Day qualifies, and that rate is the number any expansion should be decided on.

CHAPTER 02

What product detail shows

95.7%

of the braking decline at Isuzu Truck UK is one product: brake pads. A total says the business moved. Detail says where.

02

The parts classification system

Isuzu Truck UK brake pads

Where the decline sits

Portugal clutch kits: a mistake prevented

The ranked family view

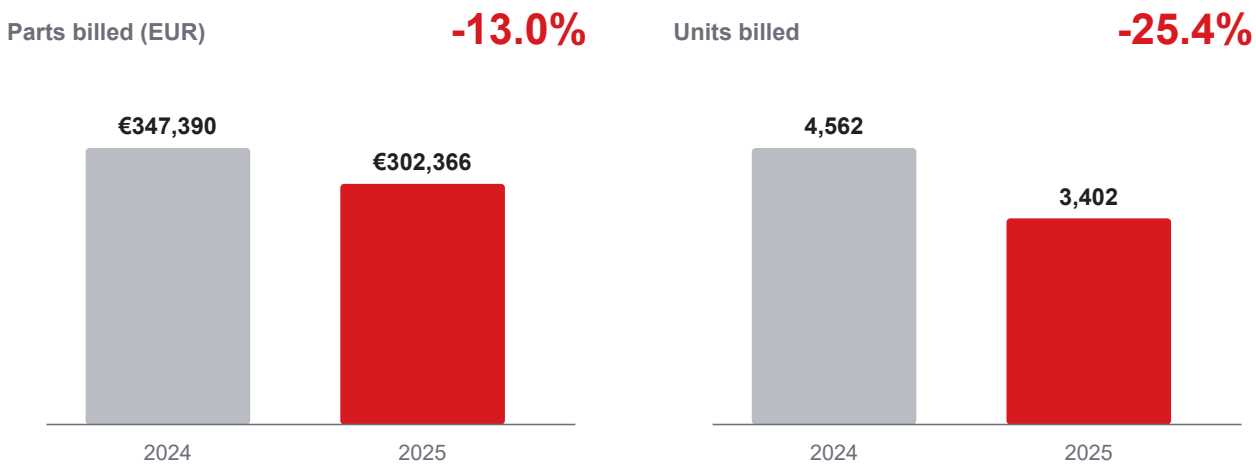

What the classification refuses to do

2.1 The parts classification system

Every example in this chapter rests on a new parts classification system built by Jérôme Van der Pluym. It places every Isuzu part number in a family, a product group and a product form (element, housing, assembly or kit) and keeps Genuine and Best Value side by side.

It answers the question a total cannot: *what is really changing in this parts business, and which references explain it?* A distributor's parts business can be flat while its composition moves a great deal, and a change in mix hides a change in quantity. The classification is what lets a parts manager move from "our parts business moved" to "brake pads moved, and these are the references behind it".

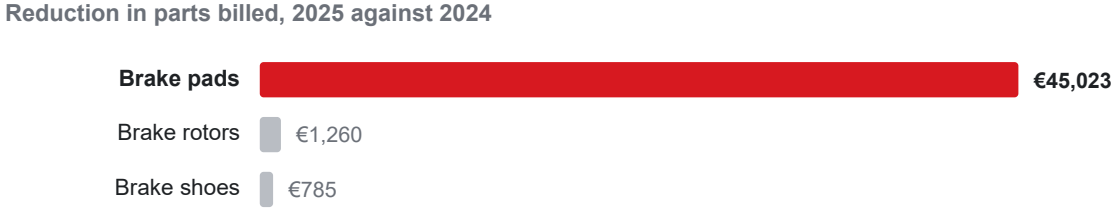

2.2 Isuzu Truck UK brake pads

Value fell 13.0%. Units fell 25.4%. ISZE billing to Isuzu Truck UK, brake pads, full calendar 2024 and 2025.

MEASURED Parts billed to Isuzu Truck UK in brake pads fell from €347,389.58 in 2024 to €302,366.25 in 2025, a reduction of €45,023.33. Units fell from 4,562 to 3,402. Read the two halves together: a revenue view suggests a demand problem, a quantity view suggests a price problem, and neither is the right first question. The gap between the two percentages is the first thing a parts manager should look at. The national figure of 22,389 Isuzu trucks in the UK is context, not the population that buys each pad, and it is not divided among dealers.

2.3 Where the decline sits

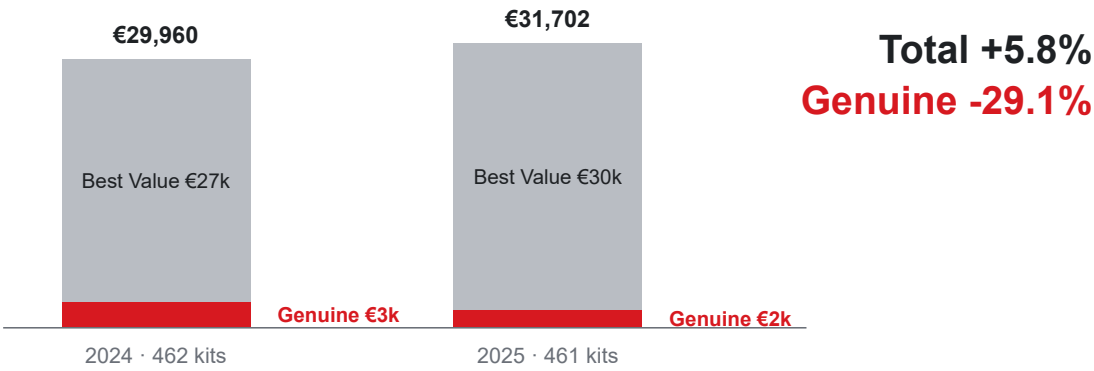

€47,068.77 across three braking categories; pads are 95.7% of it. Same source and period.

INFERRED The starting sentence changes from "braking products are down" to "brake pads are down", which is something a distributor can act on. It does not support one remedy across all braking products, and it does not turn the reduction into recoverable revenue.

2.4 Portugal clutch kits: a mistake prevented

Clutch kits billed to the Portuguese distributor (EUR)

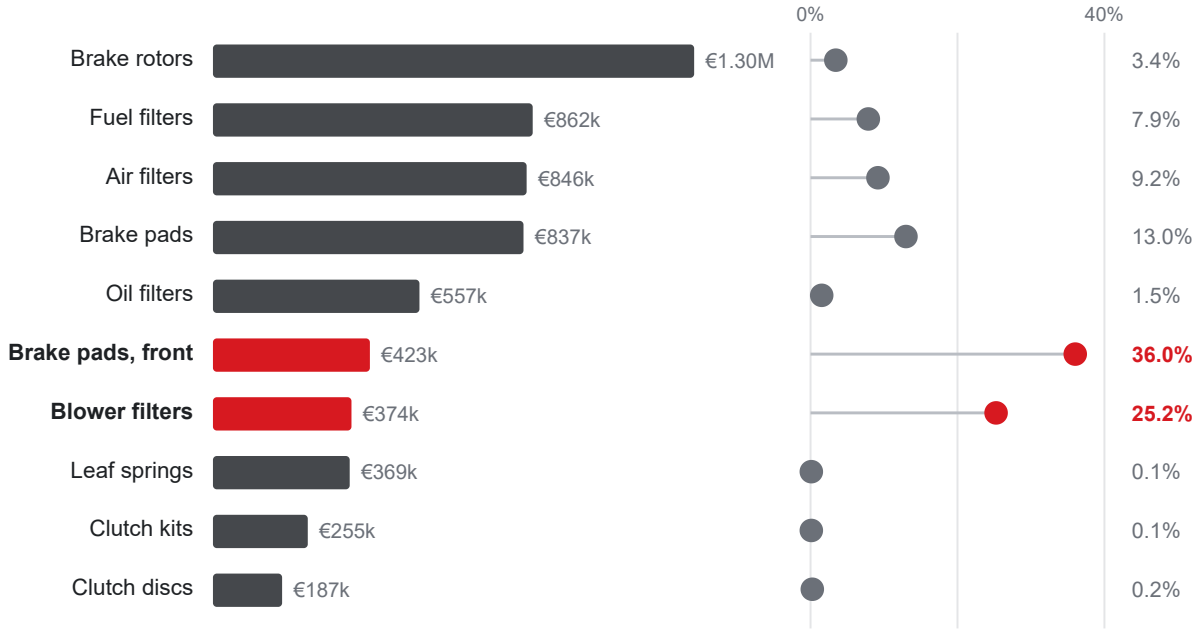

The line grew while Genuine fell. ISZE billing to the Portuguese distributor, clutch kits, full calendar 2024 and 2025.

MEASURED Combined clutch-kit billing rose from €29,959.87 to €31,702.47 (+5.8%). Genuine fell from €2,901.92 to €2,057.86, while Best Value rose from €27,057.95 to €29,644.61. Units were flat: 462 kits, then 461.

INFERRED A Genuine-only view would have proposed a recovery action for a business that grew. Here the tool earns its place by preventing a mistake rather than finding an opportunity. Genuine and Best Value are one commercial offer, and only the classification shows both answers at once.

2.5 The ranked family view

2025 billing (bars) and share billed at least 20% under the reference price (dots)

Where the maintenance-parts money is, and where it is discounted. ISZE billing of maintenance parts with a reference price, 24 distributors, calendar 2025. The ten largest families by billing.

MEASURED Two families carry a large deep-discount share on a modest base: front brake pads at 36.0% of €423k and blower filters at 25.2% of €374k. That is the shape of a handful of large deals, not a broad pricing position. Two large families carry almost none: brake rotors at 3.4% of €1.30M and oil filters at 1.5% of €557k.

INFERRED A family whose pricing is settled has no price opportunity. If it has an opportunity at all, it lies in range, application or coverage. Saying so stops a settled line being offered up as a Deal of the Day candidate.

2.6 What the classification refuses to do

1. **A product is not an opportunity just because a participant has not bought it.** No recorded purchase, a documented range gap, a coverage exclusion, a number change and an irrelevant application are five different findings.
2. **An element, a housing, an assembly and a kit are never averaged into one unit price.** Doing so describes a changing mix and calls it a price change.
3. **A missing relationship stays a visible gap.** It is never filled with a plausible match based on similar wording.
4. **Classification does not establish fitment.** A successor relationship says one number replaces another. Whether the replacement fits a given truck is validated separately before any alternative is recommended.

> **One condition before any family label reaches a distributor.** The classification must be fixed to one named release, with a version and a build date. Until then, family labels are for use inside ISZE only, because two people in the same meeting could open two versions and get two answers for the same part number.

CHAPTER 03

The programme

5 tools

Three foundations ISZE already holds, five tools a participant opens by choice, and one boundary that keeps routine service out.

03

The scope boundary
The three foundations
The five tools
Market and revenue analytics
The Dealer Standards Studio
Pricing, range and offers

3.1 The scope boundary

Universe is not a better support desk. A normal service is not a reward for participation, and participation is not the price of a normal service.

Outside Universe: stays in the existing business	Inside Universe: a commercial capability beyond that service
When will this part arrive?	Recurring, evidenced constraints may inform a range study. No arrival-enquiry workflow is built.
Is a Best Value alternative available?	Combined Genuine and Best Value positioning, product composition and range development.
Can you handle this quotation?	Competitive evidence and transparent economics for a chosen pricing or range decision.
Can you follow up this training action?	An explorable Dealer Standards profile and a development plan the dealer chooses.
Can you submit or administer this tender?	Relevant fleet and tender intelligence, and a reasoned decision on which opportunities to pursue.

The boundary matters commercially for two reasons. First, a programme that also answers availability questions will be judged on availability response times, and it will lose that comparison to a system that already answers them. Second, **the boundary is the offer**. The sentence that changes how a distributor's parts manager reads the approach is: *we are not asking you to feed a support desk, and the support desk does not get better or worse depending on what you send us.*

3.2 The three foundations

Foundation	What it holds	The question it answers
The parts classification system	Every part number in a family, product group and product form, with Genuine and Best Value side by side	What is really changing in my parts business, and which references explain it?
Isuzu Dealer Standards	The dealer self-assessment: 519 dealer records across 19 networks, 334 of them with a score	What did the dealer record about itself, and has anything moved?
The market and revenue analytics platform	Vehicles in service per market and model, target spend per truck against parts billed, maintenance-parts revenue capture, competitor price monitoring from public online prices, and the public-tender feed	Where should we concentrate effort, and is the evidence strong enough to act on?

3.3 The five tools

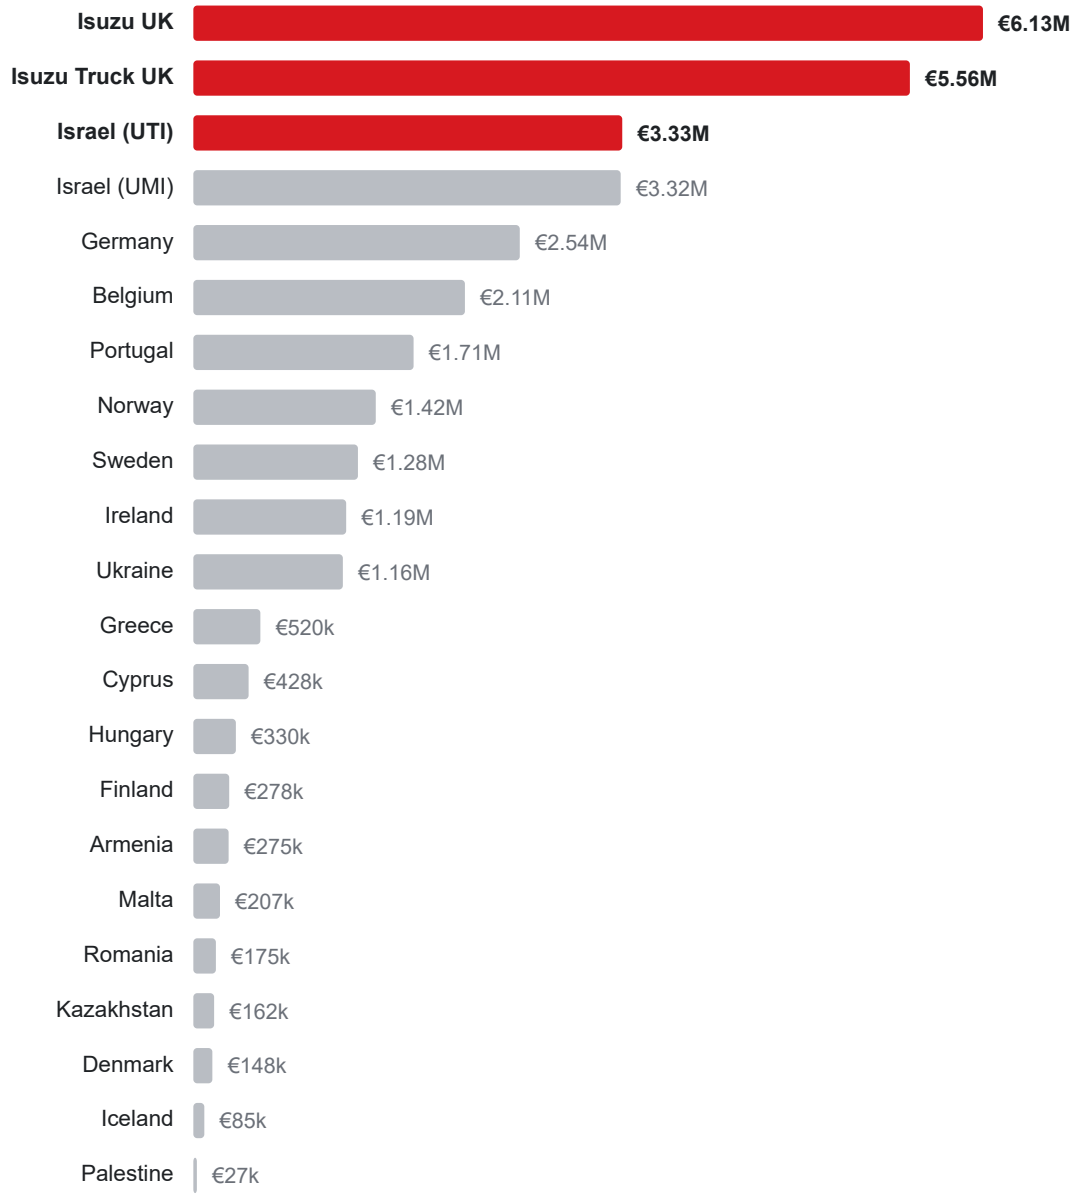

Tool	The question it answers	Built on	Designed for
Parts Atlas	What is really changing in my parts business, and where?	Purchasing history and the classification	Distributor parts manager, dealer principal
Dealer Standards Studio	What should I improve, and what has moved?	The dealer's own assessment and development record	Dealer principal, distributor network manager
Range & Offer Planner	Which products belong in this offer, and for whom?	An Atlas selection plus account coverage	Distributor commercial lead
Pricing & Margin Lab	What does this trade-off do to revenue and margin?	Comparable evidence and stated unit economics	Distributor commercial lead, ISZE
Market Intelligence	Where should we concentrate effort?	Fleet, revenue capture, online price monitoring, tenders	Distributor management, ISZE

A participant usually starts with the one question it can answer today with evidence it already has. The tools share a selection (entity, account, period, product range, permitted audience) rather than a screen, so a user can carry a selection from the Atlas into an offer plan without rebuilding it. A Dealer Standards plan needs no pricing data, and a pricing study needs no assessment. The tools are connected where the next decision gets better, and only there.

3.4 Market and revenue analytics

The platform brings four views together that were previously held apart: the **fleet** (Isuzu vehicles in service by market and model), **target spend per truck** against parts actually billed, **maintenance-parts revenue capture** by vehicle and service interval, and **competitor price monitoring from public online prices**. It also carries an early-warning view on distributors and dealers and the public-tender feed described in chapter 4. Its job is to show where revenue is being left on the table, and to say when the evidence is not strong enough to act on.

Parts billed to each distributor, calendar 2025

Where the parts business is. ISZE parts billed to 22 distributors, calendar 2025. Red: the three largest.

MEASURED For 2025 the model puts the ceiling on target spend at €55,359,060 across the markets with a fleet figure, against €32,381,311.55 of parts actually billed. Of that ceiling, €22,278,000 (40.24%) comes from 8 markets where no measured purchasing rate exists and a flat €250 per truck is assumed.

> **The ceiling is not revenue.** It is what a market could spend on parts on a modelled basis, not money available to ISZE, and two-fifths of it is an assumption. Multiplying it by a recovery percentage would invent a revenue case this paper refuses to make. Its correct use is comparative: this market sits at this share of its own ceiling, the next market at that share, and the order is the decision input.

Three rules keep the numbers honest. A national vehicle total is never allocated to dealers by sales, visits or geography. A part that serves several vehicle classes stays shared unless exclusive fitment proves which model it belongs to. And a modelled gap is not recoverable sales and not a business case.

3.5 The Dealer Standards Studio

The Studio turns the dealer self-assessment into a development tool rather than a questionnaire archive. What a dealer would see, in order:

1. Its own sections (premises, organisation, service, parts and accessories, vehicle sales), each with the number of questions answered, unanswered and not applicable.
2. The actual questions as worded, with its own recorded answer against each. Strengths are shown as visibly as weaknesses.
3. Why a chosen question is worth attention. A comparison against a group is offered only where the questionnaire and scoring are compatible.
4. A development priority it chooses, with milestones, an owner and the evidence it decides to keep.

Three records, and none updates another. The assessment is what was recorded. The development record is what the dealer agreed to do. A later reassessment is a new record. Completing a milestone does not amend an answer, raise a score or prove a commercial outcome. That is what keeps the tool useful before a second assessment round exists. There is no distributor score derived from dealer assessments and no public league table.

3.6 Pricing, range and offers

Pricing & Margin Lab. Combines competitive positioning with scenarios the user controls. Parts gross profit is revenue less the parts purchase cost of the quantities sold; freight, duty, overheads and distributor rebates are excluded from that measure, and any extra costs are shown once in a separate view. The quantity needed to preserve revenue or gross profit is an arithmetic threshold, not a forecast. Selling prices and margins further down the channel are never mandatory contributions.

Range & Offer Planner. Takes an Atlas selection and turns it into a proposed range decision or Deal of the Day brief: which products, for which accounts or vehicle segments, how Genuine and Best Value are positioned, and what would show that it worked. Execution stays in the existing business. Universe does not become an order platform or a quotation desk.

CHAPTER 04

Protecting the deal

0

cases recorded in a programme that has paid €90,000 since 2023. The money is labelled. The case is not.

04

Don't Lose the Deal at Isuzu Truck UK

The label, and the missing case

Rolling it out to every dealer

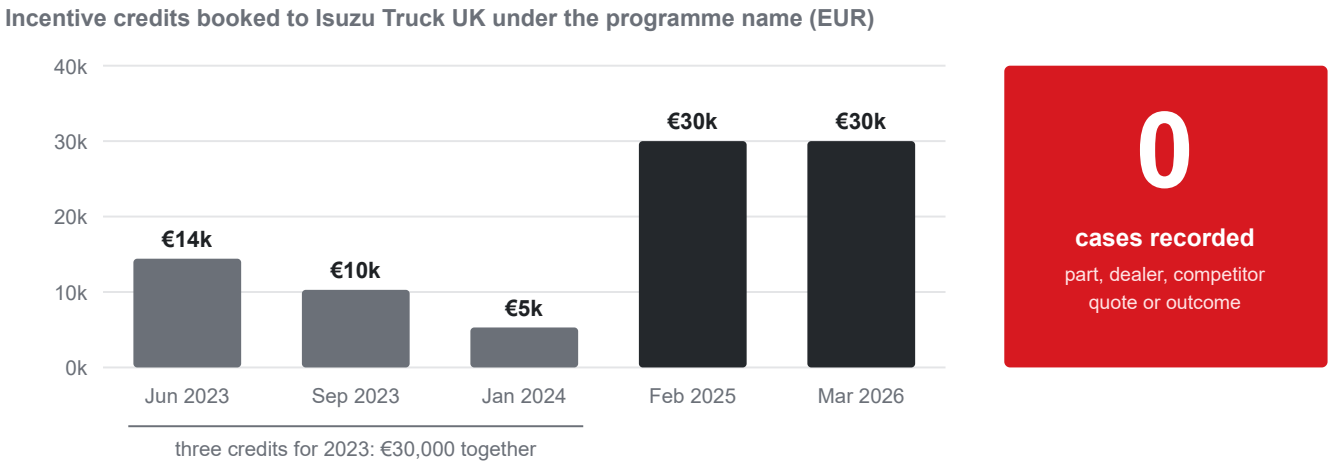

What a defended job must leave behind

The public-tender feed

One decision closes both

4.1 Don't Lose the Deal at Isuzu Truck UK

Don't Lose the Deal is Isuzu Truck UK's existing programme for competitive quotations: support that helps a dealer keep a job when the customer has a cheaper alternative in front of them. It runs on a memorandum of understanding, a rebate credit note that moves the money, and Japan-side sign-off.

A recurring €30,000 a year, and no case behind any of it. ISZE credit notes to Isuzu Truck UK carrying the programme name in the typed reference, June 2023 to March 2026.

MEASURED Five credits carry the programme name: three in 2023 and early 2024 that together make €30,000 for 2023, then €30,000 in February 2025 and €30,000 in March 2026. This is a recurring arrangement, not a one-off. €30,000 is 0.54% of the €5.56M ISZE billed to Isuzu Truck UK in 2025, which is why the programme is affordable there. The first two 2023 credits carry a slightly different label. One question to Isuzu Truck UK confirms whether they are the same programme, and it should be asked before any baseline for a rollout is fixed.

4.2 The label, and the missing case

The programme name survives in the reference typed on the original invoice records, but the working billing file that everyone searches drops that field. A search there finds nothing, and that is how the programme came to look as if it left no trace. The chain from programme name to billing line is broken in the middle, and a broken chain can be repaired: keep the field.

The deeper gap does not move. **Five labelled payments, zero recorded cases:** not one part reference, dealer, competitor quote, price gap or won-or-lost outcome. A credit note proves that support was paid. It does not prove that the customer was kept or that anything happened that would not have happened anyway. Anyone who reads rebate volume as a result is reading a payment as an outcome.

4.3 Rolling it out to every dealer

The intent is to run Don't Lose the Deal for every ISZE dealer, with Isuzu Truck UK as the template. That makes the gap urgent: rolled out as it stands, every new market buys the payment and inherits the inability to judge it. The cheapest moment to fix the record is now, while there is one arrangement to amend rather than nineteen.

Route	Support per year	Share of 2025 parts billed
Three largest markets, twelve-month evidence pilot	**€90,000**	0.28%
All nineteen markets	**€570,000**	1.76%

PROPOSED At €30,000 per market a year. The money is affordable. Judging it is the harder part, and three constraints decide the design:

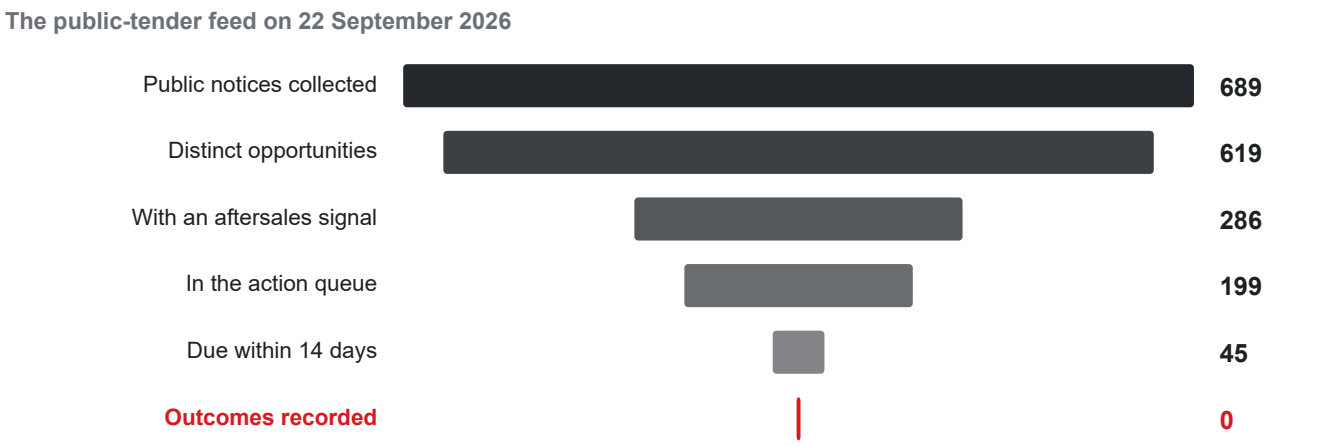

- **The sign-off path, not the cash, is very likely the binding limit.** Depending on case size, a network programme generates between roughly eight and 160 approval events a month. The design answer is to agree the envelope once and approve cases locally against a written rule. That is only safe together with the case record below.
- **Cheap cuts both ways.** A cost small enough to approve without argument is also small enough to approve without evaluation. Three years of the full network at this level, unmeasured, is about 5% of one year's parts spent on a bet nobody can judge.
- **An uncapped rollout buys activity, not evidence.** Record first, then scale.

4.4 What a defended job must leave behind

Field	Why it cannot be reconstructed later
The part	Without the reference, the case cannot be tied to a family, the only level at which an outcome can be compared.
The dealer	Which account asked, and where. Without it there is no before-and-after.
The competitor evidence	What was quoted against us, and when. A price claim with no date is not evidence.
The outcome	Won, lost, or no decision. The third state must be visible; it is not a loss.
Date, support requested and granted	What was asked for against what was given.
The follow-on order reference	Lets a win be verified in the ledger rather than asserted by the person who benefits from the support.

This takes about five minutes per case, attached to a credit note that is raised anyway: roughly €1,800 to €6,500 a year across the network. It must ride the existing credit-note step rather than become a system with its own login. A record makes a case judgeable; only a before-and-after view makes the programme evaluable.

4.5 The public-tender feed

From public notice to pursuit decision, and then nothing. The live public-tender feed, generated 22 September 2026.

MEASURED 689 notices reduce to 619 distinct opportunities, of which 286 carry an aftersales signal (a parts, service or maintenance element a distributor could supply). 199 are in the action queue and 45 are due within fourteen days. Decisions recorded so far: 2 attack, 204 selective, 75 watch, 338 ignore. 588 of the 619 opportunities carry no value figure, and the paper does not invent one. No outcomes are recorded, so the feed cannot yet show a win rate.

Four rules apply. A tender's advertised value is not expected Isuzu parts revenue, and an award is not parts billed. A notice count is not a pipeline; the deliverable is a qualified shortlist. Every opportunity carries its source and the date it was seen, because a distributor who chases a closed tender stops reading the feed. And declining is a valid outcome, with the reason recorded.

The give and the ask. ISZE gives country-relevant opportunities with the aftersales content made visible early enough to act on, and, where it fits, a combined vehicle and aftersales proposal with a headquarters brief that makes the requested decision unmistakable. ISZE asks for one line when a tender is won, lost or ignored.

4.6 One decision closes both

> In both Don't Lose the Deal and the tender feed, the event that matters happens outside ISZE, and the only trace on ISZE's side is a part that eventually ships. ISZE can do everything up to the outcome and nothing after it. **Agree to record outcomes, one line per closed case, in one shape both can read.** It is not a system, a report or a permission. It is an agreement that when a case closes, one line gets written down.

CHAPTER 05

Participation

519

dealer self-assessments already exist across 19 networks. That is what this network does when it is asked. Anything harder needs a reason the participant can feel.

05

The exchange: what we offer, what we ask

What ISZE already holds for dealers

How a dealer joins

How a distributor joins

Open for decision: a participation score

What not to do

5.1 The exchange: what we offer, what we ask

Traction comes from offering something a participant would use even if the reporting obligation disappeared tomorrow. The offer comes first, and it has to be real.

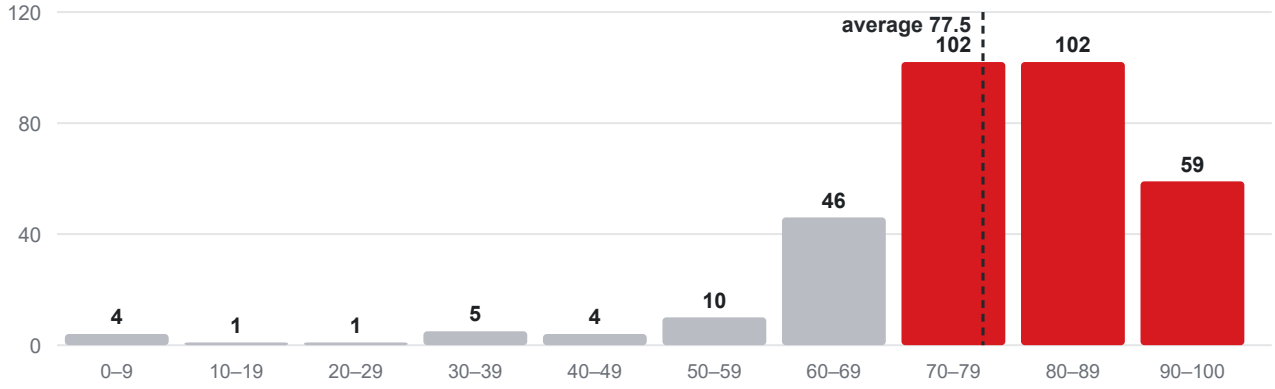

What we offer	What we ask in return
Dealers. Their own Dealer Standards answers in the real question wording, explorable by section	**The report already sent.** Reused, not re-requested; two or three definitions agreed once
Dealers. A development priority they choose, with milestones and evidence they control	**Corrections.** "Your reading is wrong" is a successful outcome
Dealers. A prepared review of their own recorded purchasing, with a way to correct it	**Maintenance and service data.** Which vehicles were serviced and which parts were fitted. It is the one input that turns modelled demand into observed demand
Dealers. A visible record of who owes the next step, including ISZE and the distributor	**Outcomes.** One line when a supported deal or tender closes
Distributors. A prepared national and network review, monthly, after a usable submission	**Never asked by default.** Dealer resale prices, customer identities, full inventory
Distributors. Product detail behind any movement, and a Deal of the Day brief on a chosen case	
Distributors. A tender proposal framework, and a development record per dealer	

PROPOSED Ordinary service is never conditional on any of this.

The sentence a dealer principal hears. "A review prepared from your recorded purchases" can sound like "my supplier's supplier is looking at my book". The design answers it directly. The review reaches the dealer only through its distributor, it covers what the distributor already receives, and the dealer decides what, if anything, goes further.

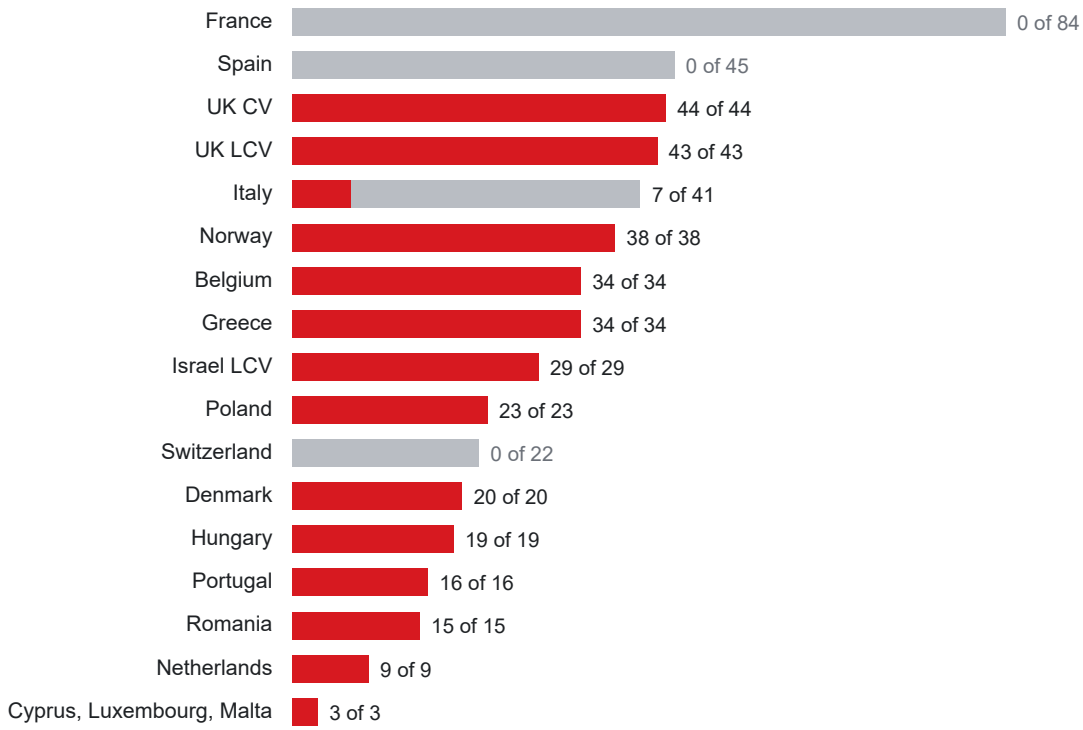

5.2 What ISZE already holds for dealers

Dealers by recorded Dealer Standards score

334 dealers carry a recorded score, average 77.5. Isuzu Dealer Standards network lists, September 2026: 519 dealer records across 19 networks, one assessment round.

Dealers per Dealer Standards network: scored (red) and listed without a score (grey)

Two thirds of the known estate already has an individual result. Same source. France, Spain and Switzerland are listed without individual scores; Italy has 7 of 41.

INFERRED This is the strongest dealer asset in the programme: the only place where ISZE holds something a dealer wants to look at and cannot easily assemble for itself. So the design opens with it. The first thing a dealer sees is its own assessment, not a supplier's reading of its business. The scores are self-assessments from one round with no per-dealer date. They are context, not a performance measure.

5.3 How a dealer joins

1. **Through the distributor.** The distributor chooses whom to invite. ISZE does not approach a dealer directly.
2. **Its own Dealer Standards profile first.** The dealer sees its own answers and chooses one development priority.
3. **A prepared review, no form.** Built from information already held. No registration and no upload in the first session.
4. **Ask for a correction, not for data.** "Your reading is wrong" and "no action needed" are both successful outcomes.
5. **Record the plan.** Milestones, owner and evidence, and the record stays with the dealer.
6. **Propose the next task, not the next report.** A repeat invitation depends on an actual commercial decision.

A funded, bounded setup task (€600, section 1.7) gives the dealer's time a price and gives the distributor something to offer rather than something to ask for.

5.4 How a distributor joins

1. **A director-level conversation, not a data request.** The recurring report is reused; nothing extra is required for the core review.

2. **Agree two or three definitions once.** Covered accounts, channels and products.
3. **Receive the first prepared review**, with the question behind it stated.
4. **Choose one case**: one range, one account pattern or one Deal of the Day, with a named owner on the distributor's side.
5. **Extend only where a case needs it**, for a defined purpose, with a named recipient and a stated return.

Two things turn acceptance into use. Answer a question the distributor already has, because a review that is merely available is not read. And make the distributor's own dealer development the visible output, because that is the framing in which the review serves the distributor's interest rather than ISZE's.

5.5 Open for decision: a participation score

PROPOSED, NOT DECIDED Whether participation should carry a score, what it counts and what it unlocks is still open and is not settled in this paper. No scores are given here. If a score is introduced, four principles would hold:

- It counts useful exchange and decisions, not data volume, logins or uploads.
- Each participant sees its own score. There is no public league table.
- Ordinary service never depends on it.
- Candidate components, for discussion: the agreed report on time and complete; corrections made; maintenance and service data shared; a tool used for a named decision; outcomes recorded.

5.6 What not to do

Do not	Why
Pay per submitted record, row or field	It rewards disclosure volume rather than useful work
Make ordinary service conditional on contribution	It turns a normal service into a bargaining chip and destroys the premise
Build a public dealer league table	Turnover favours large businesses, and assessment coverage differs by market
Ask for dealer resale prices by default	Not needed for the core review, and the most sensitive item on the list
Approach a dealer directly	The distributor owns the relationship and the audience decision
Count logins or uploads as participation	Neither is evidence that a decision improved

CHAPTER 06

The money

0.31%

of one year's parts billing: the size of the €100,000 route. The right size for a pilot, and the wrong size for a platform.

06

The denominator

The hurdle

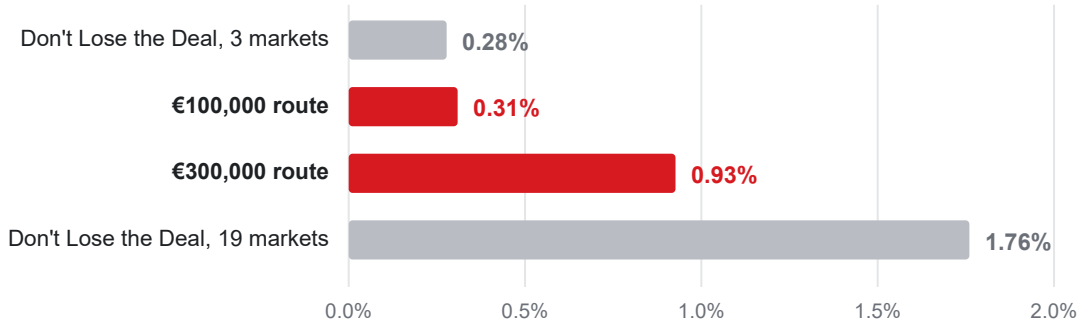

The price of a dealer

The existing rebate floor

Which route

6.1 The denominator

Each envelope as a share of €32.4M parts billed in 2025

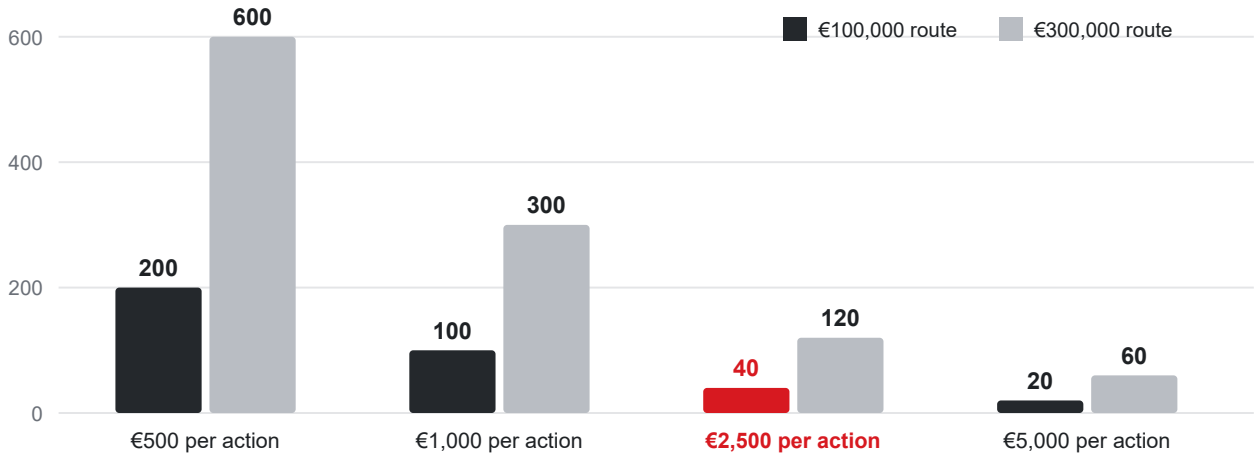

Every envelope in this paper is under 2% of one year's billing. ISZE parts billed to 22 distributors, calendar 2025, €32,381,311.55. The Don't Lose the Deal routes are at €30,000 per market a year.

MEASURED ISZE billed €32,381,311.55 of parts to 22 distributors in 2025. The €100,000 route is 0.31% of that and the €300,000 route 0.93%. The programme does not need to move the whole business to justify itself, and it must not be presented as if it will.

6.2 The hurdle

Beneficial actions needed to earn back each envelope

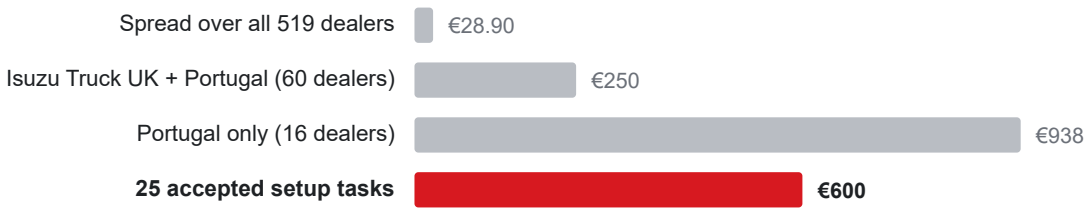

At €2,500 per beneficial action, the €100,000 route needs 40. Illustrative arithmetic: envelope ÷ assumed contribution per action. The contribution is an assumption, not an estimate of dealer profitability.

ILLUSTRATIVE At €500 per beneficial action the €100,000 route needs 200 of them and the €300,000 route 600. At €5,000, 20 and 60. The honest break-even for €100,000 is **40 qualifying actions at €2,500 each**. That number belongs in the funding discussion, not in a footnote after approval. A pilot of ten Deals of the Day at €2,500 each is €25,000 against €100,000: it establishes whether the mechanism produces qualifying actions at all. The hurdle is higher again once internal time is included, so report the cash-only and the fully costed comparison separately.

6.3 The price of a dealer

What €15,000 of dealer enablement buys, per dealer

The same €15,000 is a gesture or a programme, depending on where it goes. Dealer counts from the Dealer Standards network lists, September 2026: 519 in total, 44 at Isuzu Truck UK, 16 in Portugal.

INFERRED €15,000 spread across 519 dealers is €28.90 each and buys nothing that survives contact with a dealer principal. The same €15,000 spent as twenty-five accepted setup tasks at €600 in two pilot markets buys twenty-five completed onboarding experiences. Same money, completely different product. The recommendation is the second.

6.4 The existing rebate floor

MEASURED In 2025 a share of the normal distributor rebate was tied to a major performance submission, and the submission arrived. That is the floor: the file exists because the rebate depends on it. Nothing in that arrangement gives a distributor a reason to open anything, correct anything or send anything the rebate does not name. The euro value of that share is not stated in this paper. It should be added before the funding discussion, so the programme is weighed against the incentive already being paid.

6.5 Which route

PROPOSED Start at the €100,000 route and re-point its Deal of the Day element as set out in section 1.7. The €300,000 route adds dealer enablement and resilience before anyone knows how often a Deal of the Day qualifies, so it should wait for that rate. Nothing here is a new budget request or an approved expenditure. It is a recommendation inside the existing €0, €100,000 and €300,000 planning envelopes.

CHAPTER 07

Decisions, and when to stop

3

decisions this month, one order to build in, and one stop condition that does not bend.

07

The three decisions

The build order

Go, no-go and stop

Ownership and the unowned answer

Delivery, competition and privacy

What is still unknown

7.1 The three decisions

Decision	Recommendation	What has to be true first
Fund Deal of the Day	€60,000 to €90,000 as a named line inside the €100,000 route, with a €150,000 floor per Deal of the Day	The selection rule is agreed and the first Deal of the Day is named
Approach ten dealers	Through the distributor, opening with the dealer's own Dealer Standards profile and a prepared review	A prepared review exists from data already held
Build two tools first	Parts Atlas and Dealer Standards Studio	The classification is fixed to one named release

7.2 The build order

Stage	Result	Evidence needed to move on
1. Agree scope and portfolio	Five tools and the written exclusion of routine service	This paper and the presentation say the same thing
2. Fix the classification release	One named version and build date	A family and product-form view reproduces from it
3. Open two prepared views	An Atlas view and a Dealer Standards profile, ready before the first invitation	A participant completes a real task and finds it clearer than today's review
4. Run the dealer sample	Ten dealers in two markets, including one reluctant to add reporting work	Corrections, useful output, total effort and reasons for non-use, all recorded
5. Run Deal of the Day	At least two Deals of the Day above the floor	Contribution measured on the same scope before, during and after, including returns
6. Record outcomes	One case record for Don't Lose the Deal and tenders	Cases closing with the fields in section 4.4
7. Evaluate, then extend or narrow	A stated result, favourable or not	Real evidence of effort and usefulness, not a rendered screen

The order is a dependency order, not a schedule. Stage 2 blocks stage 3. No earlier week estimate is carried over as a promise.

7.3 Go, no-go and stop

> **Go** if, at the pilot review, a real participant completed a real analytical task, the output was correct against its source, and the participant can name the decision it changed.
>
> **No-go** if the only evidence is that a screen rendered, a file arrived, or somebody said the demonstration looked good.
>
> **Stop** if, after two eligible cycles, no participant can name a decision the tool changed, or if a confidentiality or identity weakness cannot be closed. The programme stops. It does not pause, add a report, or widen the population to look for a better sample.
>
> The honest test underneath all of it: **if the incentive that produces the file today were removed tomorrow, would anyone open the tool anyway?**

7.4 Ownership, and the unowned answer

The commercial question, the design of the exchange, the analytical examples and the definition of a useful output are owned inside ISZE Parts. Specialist work is bounded, each piece a task with an accepted deliverable and a handover: access isolation, durable shared records, reliable imports, recovery, and any connection to company systems. Existing classification, analytics and Dealer Standards work is reused where fit for purpose, not rebuilt.

What no amount of software closes is the answer. The product pays off when ISZE answers a participant's question, and nobody has yet been named, given hours, or funded to do that. Software is cheap at the margin and a person's time is not. The risk is that the cheap half gets built, the expensive half gets deferred, and the product arrives looking complete while the thing it was for never happens.

7.5 Delivery, competition and privacy

Delivery. There is no production system yet: no shared case service, no production identity, no attachment storage. The access rules that matter (only the authorised distributor sees its own accounts and terms, only the dealer sees its own record, no distributor sees another's submissions) must be enforced by the operating application and by what exports contain, not by hidden menus. Until that is built and independently reviewed, the first shared use stays distributor-led and document-based.

Competition law. Under the European motor-vehicle block exemption framework, the current regime runs until 31 May 2028. Nothing here is a legal determination, and the design has not yet been reviewed for competition-law compliance. Three standing rules are proposed: **no exclusivity in exchange for information**; **no price coordination between distributors**, so Universe compares a distributor with its own history and permitted aggregates and never passes one distributor's terms or plans to another; and **no resale-price instruction**, so ISZE sets its net price to the distributor and Universe neither prescribes nor keeps dealer resale prices. The responsible function reviews this before any shared output is used with a participant.

Privacy. The recurring exchange is price-free by default. Selling prices, resale margins, customer identities, vehicle identifiers, full inventory and workshop job cards are never added silently. Where a financial outcome is needed, a locally calculated aggregate may be enough, and an aggregate is not automatically anonymous.

7.6 What is still unknown

Unknown	Why it matters
Who answers the participant's question	The product pays off only when someone does, and the money depends on it
How often a Deal of the Day qualifies	It is the number that decides whether expansion is warranted
Whether a dealer returns after the first task	It is the stop test, and it has never been observed
Whether a defended job would otherwise have been lost	Without it, Don't Lose the Deal spend cannot be read as a return
Why a customer bought elsewhere	The question behind every commercial gap; the billing system never recorded it
Whether a distributor's dealers cover the vehicles that buy a part	Without it, a coverage statement is a guess
Whether a participation score is introduced, and what it unlocks	Open for decision (section 5.5)
The euro value of the rebate share tied to reporting	Needed to weigh the programme against the incentive already paid

Reference: terms used in this paper

Term	Meaning
Parts billed	ISZE sales to the stated distributor
Sales to dealer	The distributor's recorded onward sales to its dealers; not what a dealer sold to a customer
Parts gross profit	Revenue less the parts purchase cost of the quantities sold; freight, duty, overheads and distributor rebates excluded
Contribution	Parts gross profit less extra Deal of the Day costs not already included
Reference price	The applicable list reference for the entity and period. A reference valuation is not a transaction
Deep concession	A billed price at least 20% under the reference price, on a line that carries one
Best Value parts	The lower-priced counter part sold alongside Genuine. A pairing is a catalogue relationship, not a fitment approval
Maintenance parts (PMS)	Periodic maintenance and service parts: filters, brakes, clutch and related wear parts
Target spend per truck	A modelled expectation of what a market could spend per vehicle, which depends on assumptions
Eligible fleet	The vehicles a selected part actually applies to; never allocated from a national total
Qualifying Deal of the Day	One whose eligible billing base is above the stated floor
Isuzu Truck UK / Isuzu UK	Two separate UK distributors, trucks and pickups respectively, never combined
Calendar and fiscal year	Isuzu's fiscal year runs April to March. The historical examples here compare full calendar years

Where the numbers come from

Source	Used for
ISZE billing to distributors, calendar 2023 to 2026	Parts billed, the brake-pad and clutch-kit examples, the denominator, the Don't Lose the Deal credits
ISZE maintenance-parts pricing analysis, 2024 and 2025	Deep concession by distributor and family, the Isuzu UK air-filter case, the price-response measurement
Target spend per truck model, 2025	The modelled ceiling and the share resting on the flat per-truck assumption
Isuzu Dealer Standards network lists, September 2026	Dealer counts, score distribution, the price of a dealer
Public-tender feed, 22 September 2026	The tender funnel and recorded decisions
Don't Lose the Deal network rollout design, September 2026	Rollout routes, approval volume and the cost of the case record

Every chart in this paper is drawn from these records at the time the paper was produced. Historical observations keep their original period. Tool designs, journeys and funding lines are proposals as of 23 September 2026.
