AIM / PRICING DECISIONS 0.2

What the Cursor pack changes

Use the price history and competing-offer records now; do not treat the pack as approval of current customer prices or actual gross profit.

22 September 2026 | ISZE internal review. The existing five-case interface has been updated, not replaced by another application. Its January-June 2026 billing reference remains unchanged.

The five decisions after reading the actual rows

Customer / part	Recorded list versus 2025 snapshot	Decision now
I Motors 5876150180 BVP cabin filter	EUR 15.74 to EUR 16.10 (+2.3%)	Review customer terms first. The modest list step does not explain the earlier low-price order.
ITUK 8981654483 Complete turbocharger	EUR 1,059.33 to EUR 1,076.18 (+1.6%) EUR 1,114.96 (+5.3%)	Resolve the applicable price and validity before a price move. Both source candidates stay visible.
ITUK 8982447940 Front brake-pad kit	EUR 89.85 to EUR 89.11 (-0.8%)	Use a matched-kit, eligible-volume test. Do not discount the recovering base indiscriminately.
ITUK 8982488951 Front brake disc	EUR 141.29 to EUR 158.83 (+12.4%)	Review the list step, customer terms and the recorded predecessor before judging the cause.
I Motors 5876150530 BVP oil-filter element	EUR 4.63 to EUR 4.63 (0.0%)	Protect the observed price. Neither an automatic cut nor an increase is established.

Basis: price_observations in the supplied JSON. Prior values are the 31 December 2025 snapshots; later values are labelled 13 March 2026/current-list records in the export. Amounts are EUR per stated price unit, tax excluded. The turbo source remains conflicted. These are not dealer resale prices or confirmed current customer quotations.

Decisions, not an automatic discount engine

The useful change is the separation of list movement, observed customer pricing and evidence of a competing offer.

Start with the two brake cases

ITUK pad kit 8982447940. The archive has dated brand-level offers from Spareto and UK shops. Spareto is one seller, not one seller per brand. The list snapshot decreases by 0.8%, while the existing matched first-half billing comparison increases by EUR 29,969. A complete-kit quotation and current customer terms are the next checks; a blanket cut would spend money on a recovering base.

ITUK disc 8982488951. The list snapshots establish a 12.4% step on the surviving number. That is distinct from the unchanged ordinary-order billing price in the earlier comparison. The newest-number field links 8982488950 to 8982488951, but the record is not technical approval. Keep the separate exact-number and related-number observations.

Do not manufacture a reason to cut the other three

I Motors cabin filter 5876150180. The list step is 2.3%, not the 49.9% change in the historical weighted billing average. The earlier low-price PRD-coded order is real; the contract or support-expiry explanation is not supplied. The former automatic parity range has been removed.

ITUK turbo 8981654483. The two recorded candidates are EUR 1,076.18 and EUR 1,114.96. Relative to EUR 1,059.33 in the 2025 snapshot, the recalculated changes are 1.59% and 5.25%. The pack incorrectly uses 3.6% for the lower comparison. A pricing authority must settle the valid offer; the tool does not choose for them.

I Motors oil filter 5876150530. EUR 4.63 appears in the 2024, 2025 and later list records. The supplied pairing to Genuine 8982705240 improves range context, but no exact-number cost record or comparable quotation supports an automatic increase.

What the calculator now does

It starts with an unchanged price and zero assumed volume response. A user can explicitly select a historical average, a recorded list candidate or a manual net-price assumption. Existing-volume discounts and incremental-only offers remain separate. Costs are manual assumptions, and no approved margin floor is invented.

Sources: supplied case_readiness_and_findings, price_observations, competitor_observations and part_relationships; previously source-checked exact-part billing and national sales-to-dealer data. Price interpretations above are this review, not an unchanged reproduction of the pack narrative.

Source acceptance: material exceptions

The supplied rows were retained. The following source limitations prevent automatic commercial conclusions, not the supported purchasing review.

Costs: a model is not an accounting cost

Only four of the five cases have a derived FOB record, and the pack uses a rate labelled effective from 1 October 2026. Freight and duty are excluded; the oil-filter case has no cost record. Restricted values are not embedded, and actual gross profit remains uncalculated.

Terms: the detail contradicts the readiness label

The case table says historical terms are usable, but the detailed register says customer discount, rebate, quantity-band and relevant special-price agreements were not located. Account-applied JPY base-price rows have blank amounts. List history and observed invoices do not establish the current net offer.

Reporting dates: keep the reference explicit

Both distributors have monthly billing rows through August 2026. That contradicts the statement that ITUK stops in June. The existing January-June matched comparison is retained for both pilots; later rows are not silently adopted and do not refresh the fleet or other evidence.

Order-type summary: coverage is unresolved

For the cabin filter, the monthly rows contain 200 units through June and 310 through August 2026. The supplied annual order-type summary contains 160. It is withheld from new calculations; the previously checked reference detail remains. PRD is not redefined from the export narrative.

Competitor evidence: a lead is not parity

Spareto supplies 13 pad entries and six disc entries from one seller, without declared VAT or pack contents. Six UK shop pad observations carry stated conversions but remain dated evidence. Derived minimum-price rows and unsuccessful searches are not additional independent competing offers.

Checks and remaining decisions

A successful import is not a complete commercial case

The structural and selected-source reconciliation run contains 382 passed checks and one failed check: the pack header gives 3,945 records, while its 12 actual data tables contain 3,856. This count discrepancy does not alter the selected billing comparisons, but the header is not accepted as a control total.

Other narrative exceptions remain visible, including the turbo arithmetic and the impossible V01 statement, "5 of 4 comparable numbers equal". They were reviewed separately rather than counted as a global green result.

The updated component passed 51 arithmetic/regression checks and 82 browser interaction checks. Browser checks used the exact HTML in memory: managed Chromium blocked direct-file navigation. Direct-file behaviour and persistent storage on the user's Windows machine were not verified.

What is still needed, without repeating the full data request

Decision / source	Smallest remaining item
Applicable customer offer	Confirm the current net price, effective date and eligible terms for each case; identify the authoritative turbo record.
Profit protection	Provide an approved case-level accounting/replacement cost and its inclusions, or an authorized local profit calculation. The derived future-rate FOB is not that input.
A comparable competitor quotation	Verify complete pad-kit contents, price per disc or pair, relevant application, tax, delivery and validity. Refresh only the selected comparison.
Why purchasing changed	Record the customer/supply explanation when obtained. Billing alone cannot recreate a rejection, a lost quote or an inventory movement.

Delivery and scope

The original interface and incoming JSON remain unchanged. Version 0.2 is an internal component with both pilots embedded, not an Atlas release or distributor login. Its exports contain the selected case only. The restricted cost records and source invoice line are excluded from the browser and source handoff.

Input: ISZE_AIM_PRICING_DECISION_PACK_2026-09-22.json, inside the supplied ZIP. Exact JSON row pointers are shown beside imported observations in the interface. SHA-256: 4d3bf8cd23f9de4caac35b9ef0c0d223654046b030f2a12dba18e8b4d163f573
