ISUZU

Tender Intelligence as a Commercial Strategy

How ISZE, vehicle sales, and distributors can combine public procurement intelligence to grow genuine parts revenue and defend market share

ISZE Vehicle Parts Sales · March 2026 · CONFIDENTIAL

SECTION 1

Executive Summary

Public procurement represents one of the most transparent, predictable, and underutilised commercial channels available to Isuzu's European distribution network. Every year, hundreds of public authorities across Europe tender for light commercial vehicles, pickup trucks, and fleet maintenance contracts — the exact product categories where Isuzu competes. Yet Isuzu's distributor network has no systematic mechanism to identify, qualify, and act on these opportunities.

This brief argues for a three-entity approach: Isuzu Motors Intl Europe (vehicle sales), ISZE (aftersales intelligence hub), and the local distributor (commercial executor) operating as a connected pipeline rather than three independent silos. The tender monitoring platform already built by ISZE is the connective tissue for that pipeline.

€136B	52%	43.6%	17%
European aftermarket market size 2024	OEM genuine parts market share — declining	Ford Ranger European pickup segment share 2024	Ford Pro EBIT from aftermarket & services

The core problem is not product quality or price. It is visibility. Distributors do not know which public fleets in their territory contain Isuzu vehicles, who is maintaining them, and when those maintenance contracts are up for renewal. Tender intelligence solves the visibility problem.

SECTION 2

The Integrated Commercial Approach

The current model is sequential and fragmented. Vehicle sales wins a fleet tender. Vehicles are delivered. The aftersales relationship either develops organically or — more often — it does not. ISZE has no visibility into which fleets have been won. The distributor sources parts from whoever is convenient. The connection between vehicle placement and parts revenue is left to chance.

Three actors, one pipeline

Actor	Role in the pipeline	What tender intelligence adds
Vehicle Sales dept.	Identifies and converts fleet vehicle purchase tenders. Delivers the vehicles.	Early sight of planning-stage tenders. Time to build buyer relationship before tender opens. New registrations fed back to ISZE immediately as UIO data.
Aftersales dept.	Parts supply hub. Pricing, SPA agreements, genuine parts strategy. Fleet intelligence owner.	Runs the tender monitor weekly. Qualifies leads. Routes to right distributor. Tracks which fleets are in the active parts pipeline.
Distributor (DB)	Local commercial executor. Services the fleet, wins the service contract, places parts orders with ISZE.	Receives a pre-qualified lead brief per opportunity. Clear action: approach the fleet buyer or the maintenance contract winner. No tender jargon — just who to call.

The parts revenue lifecycle

A single fleet tender win of 20 vehicles generates a parts revenue stream over the vehicle's 8–10 year operational life. Using a benchmark of £580 per vehicle per year, a fleet of 20 units represents approximately £116,000 in annual parts potential — or £928,000 over an 8-year lifecycle. That figure assumes full genuine parts capture through the authorised channel. Internal analysis consistently shows that actual capture rates fall well short of this figure. The gap between the addressable opportunity and what is actually captured is the commercial case.

Fleet scenario	Units	Annual parts potential	8-year lifecycle value
Small public tender (e.g. municipal)	10	~£58,000	~£464,000
Medium fleet (police, utility)	30	~£174,000	~£1.4M
Large framework (national)	100+	~£580,000+	~£4.6M+

Based on UK distributor True Sales benchmark of £580 per vehicle per year. Assumes full genuine parts capture. Actual capture depends on distributor engagement.

R&M; contracts — the highest-value tender category

Within public procurement, there are two distinct tender types relevant to Isuzu's network: vehicle purchase tenders (a fleet buys new vehicles) and Repair & Maintenance contracts (a fleet outsources the ongoing servicing of its existing vehicles to a third-party maintainer for a fixed multi-year period). For ISZE and its distributors, the R&M contract is by far the more commercially valuable of the two — and it is the one most consistently overlooked.

Advantage	Why it matters	Isuzu / DB implication
Predictable, recurring revenue	R&M; contracts run 3–5 years. Parts demand for the covered fleet is locked in for the contract duration.	ISZE can plan supply and SPA pricing with visibility. DB has a guaranteed parts order pipeline.
Zero IAM leakage during contract	Once an authorised DB wins the R&M; contract, the maintainer sources parts through the authorised channel for all contracted vehicles.	Genuine parts capture rate goes from near-zero to near-100% for the covered fleet during contract life.
Lock-in effect	Switching maintainers mid-contract is operationally disruptive and contractually penalised. Once in, the incumbent is hard to displace.	A DB that wins the R&M; contract at year 1 is likely to win the renewal at year 4. Each win compounds.
Fleet scale per contract	A single R&M; tender covers every vehicle in the fleet — not just new units. Existing Isuzu vehicles already in the parc are captured.	Highest leverage on existing UIO. No new vehicles need to be sold — the existing fleet generates the revenue.
Positions DB as fleet partner	Winning an R&M; contract elevates the distributor from parts supplier to fleet operations partner — a structurally different relationship.	Renewal decisions and fleet expansion conversations happen with the R&M; holder, not the vehicle sales team. DB gets first call.
Renewal visibility	R&M; contracts must be re-tendered when they expire. The tender monitor captures the renewal tender before it is awarded — giving the DB advance warning to defend.	Incumbent DBs can be alerted when their own contract is approaching renewal. No surprise losses.

R&M contracts are the most direct path to genuine parts revenue growth without selling a single additional vehicle. The vehicles are already in the field. The question is only whether an authorised Isuzu distributor is the one maintaining them — or whether that revenue is flowing to an independent aftermarket operator. The ISZE tender monitor flags every R&M contract tender automatically, with a pre-drafted distributor action note for each one.

SECTION 3

How Competitor OEMs Operate — Market Study

Isuzu is not operating in a vacuum. Its primary competitors in the light commercial vehicle and pickup segment have made systematic fleet intelligence and proactive aftermarket engagement a core part of their commercial model. The gap between Isuzu's current approach and the competition is structural, not tactical.

Ford Pro — The Blueprint

What is Ford Pro? Ford Pro is Ford Motor Company's dedicated commercial vehicle division, created in 2021 to serve businesses and public sector organisations that operate fleets of vans, pickups, and light trucks. It is a separate business unit within Ford — not simply a fleet sales team — covering vehicles, service, financing, and software under one umbrella. Ford Pro competes directly with Isuzu in the pickup and light commercial vehicle segment across Europe, and its Transit van family dominates European fleet procurement. It is the most relevant benchmark for how a modern OEM monetises a commercial vehicle fleet relationship.

Ford Pro is the clearest example of what a fully realised commercial vehicle intelligence operation looks like. Where most OEMs still treat vehicle sales and aftersales as separate conversations, Ford Pro bundles vehicles, telematics, software, financing, and service into a single commercial offer — targeting both public sector fleet operators and private businesses from the moment they first appear in a procurement pipeline.

- **€66 billion revenue, €6.8 billion EBIT (2024)** — a 10.3% margin that makes Ford Pro the most profitable commercial vehicle operation in the industry.
- **Target: 20% of EBIT from software and services by 2026.** Software subscriptions reached 757,000 in 2024, up 30% year-on-year. Aftermarket parts, software, and services already contribute 17% of Ford Pro EBIT.
- **Ford Pro Intelligence platform** analyses 1 billion vehicle data points daily, enabling proactive maintenance alerts to fleet managers and pre-emptive parts ordering. The fleet knows before the garage does when a service is due.
- **2,400 mobile service vehicles** in Europe — repair orders grew 70% in 2024. Ford goes to the fleet, not the other way around.
- **Public sector is an explicit target market.** Ford Pro's government and public fleet programme is a dedicated sales motion, not an afterthought.

What does '17% of EBIT from aftermarket' actually mean?

For readers outside the automotive industry, this figure deserves unpacking — because it is a fundamentally different way of measuring commercial success than the metric most people associate with vehicle companies (how many vehicles were sold).

When Ford says 17% of Ford Pro's EBIT comes from aftermarket and services, it is measuring the revenue earned *after* the vehicle has been delivered. This includes: genuine replacement parts (filters, brakes, clutch kits, EGR components); labour from Ford authorised service centres; fleet maintenance and repair contracts (where Ford or an authorised partner is contracted to keep the fleet running for 3–5 years); telematics subscriptions (vehicles transmitting live health data to fleet managers); fleet software and uptime platforms; and increasingly, charging infrastructure management for electric commercial vehicles.

The significance of this number is not that Ford sells a lot of parts. It is that Ford has structured its entire commercial operation so that winning the initial vehicle tender is just the first transaction in a relationship that generates revenue for the next 8–12 years. The vehicle is the door; the aftermarket is the house.

Why tender win rate is the wrong metric to chase

Many organisations benchmark OEM competitiveness by asking: what percentage of public tenders does each brand win? This is a natural question but it measures the wrong thing. Consider two hypothetical distributors:

	Company A	Company B
Tender win rate	40%	25%
Genuine parts capture post-sale	Near zero — no follow-up structure, fleet sources parts from IAM wholesaler	High — authorised dealer contacted at delivery, SPA terms agreed, parts orders flow through genuine channel
Revenue per vehicle over 8-year lifecycle	Vehicle margin only (one-time)	Vehicle margin + £580+/vehicle/year in parts = £4,600+ per unit over lifecycle
Conclusion	**Looks better on a win-rate scorecard.**	**Generates 5–10× more total commercial value per vehicle placed.**

Ford Pro's 17% EBIT from aftermarket tells us that Ford is Company B, systematically. That is the benchmark Isuzu should be working towards — not the tender win rate, but the depth of commercial relationship per vehicle placed.

> **The Ford Pro model in one sentence:** identify the fleet before it tenders, embed the data connection at vehicle delivery, and convert every service event into a genuine parts order — automatically. The tender is the entry point. The aftermarket is the business.

Volkswagen Commercial Vehicles — Subscription Lock-in

Volkswagen Commercial Vehicles (VWCV) takes a different but equally systematic approach. Rather than building a separate business unit, VWCV embeds telematics and fleet connectivity at the factory level, making the vehicle itself the intelligence layer.

- **Connect Pro subscriptions generated €127 million in 2024** — recurring revenue from fleet telematics, maintenance scheduling, and utilisation dashboards.
- Factory-embedded telematics deliver maintenance alerts directly to fleet managers, **shortening the decision cycle and routing service work to authorised VWCV dealers** rather than independent garages.
- The result: genuine parts capture rate in VWCV authorised channels is structurally higher than for brands without this connectivity. **The vehicle itself is the sales tool.**

Toyota — Structural Reorganisation Around Aftersales

Toyota's response to the aftermarket challenge is organisational. Recognising that the traditional separation between vehicle supply chain and parts supply chain creates gaps in fleet coverage, Toyota has merged its inbound and aftermarket supply chain departments into a single division (PDAD), with an explicit mandate to improve genuine parts capture across the fleet lifecycle. This structural change reflects a strategic conviction: aftermarket revenue is not a by-product of vehicle sales — it is an equal objective.

Stellantis and Mercedes-Benz Vans — Following the Same Logic

Stellantis has explicitly stated that it is following the Ford Pro model for its commercial vehicle operations (Citroën Berlingo, Peugeot Expert, Fiat Ducato). Mercedes-Benz Vans operates a dedicated fleet division with direct public procurement engagement teams in Germany, France, and the UK. Both treat public fleet tenders as first-contact opportunities to establish a parts relationship, not as one-off vehicle sales events.

Competitive positioning summary

OEM	Fleet intelligence approach	Genuine parts mechanism	Isuzu gap
Ford Pro	Dedicated business unit, 1B data points/day, proactive tender targeting	Ford Pro Intelligence triggers parts orders automatically via telematics	No comparable intelligence operation in Europe
VWCV	Factory-embedded telematics, Connect Pro subscriptions (€127M, 2024)	Maintenance alerts route service to authorised channel	No telematics connectivity in ISZE distribution model
Toyota	PDAD structural merger of vehicle + parts supply chains	Integrated supply chain reduces parts leakage to IAM	ISZE operates as a pass-through; no integrated planning
Mercedes Vans	Dedicated public fleet sales teams (DE, FR, UK)	Direct fleet relationship maintained post-sale	ISZE relies on distributor initiative

SECTION 4

The Real Cost of Doing Nothing

The default position — continuing without a structured tender intelligence function — is not a neutral choice. It is an active decision to cede ground to competitors, independent aftermarket operators, and erosion of the genuine parts base. The costs are quantifiable.

1. The genuine parts revenue gap is growing, not shrinking

Internal ISZE analysis identifies a significant genuine parts revenue gap in at least one key distributor market. Cross-referencing actual vehicle parc data against parts orders placed through the authorised channel reveals that the majority of routine maintenance parts are being sourced outside the genuine Isuzu supply chain.

> A genuine parts capture rate well below 10% means ISZE is watching the majority of its addressable aftersales revenue flow to independent aftermarket operators. Every year without a systematic intervention, those operators deepen their relationship with the fleet maintainer. **It becomes harder to recapture, not easier.**

2. The Kosha gap is unbridgeable without new commercial mechanisms

IML's Kosha study (January 2026) projects ISZE Vehicle Parts revenue at €52.1M by FY2031, a 76% increase from the FY2024 actual of €29.6M. This target is not achievable through organic growth alone in a market growing at 6–7% per year. The compound annual growth rate required is approximately 10% — roughly 1.5 times the market rate.

FY Year	Kosha target (€M)	Market CAGR implied (€M)	Gap vs. market growth
FY2024 actual	€29.6M	€29.6M	—
FY2026	€32.3M	€33.7M	Market ahead
FY2028	€37.5M	€38.5M	Market ahead
FY2031	€52.1M	€43.2M	**+€8.9M must come from new commercial mechanisms**

Market CAGR implied = 6.35% applied to FY2024 baseline. Kosha targets from ISZE PL Plan FY2026–2028 (IX study sheet).

3. OEM genuine parts market share is eroding across the industry

The European automotive aftermarket is worth €136 billion (2024). OEM genuine parts hold a 52.2% share — but this share is declining as the independent aftermarket (IAM) consolidates and online parts platforms make non-genuine sourcing easier for independent garages. Without proactive fleet engagement, the default trajectory for any OEM's genuine parts share is downward. The brands reversing this trend — Ford, VW, Toyota — are doing so through deliberate, structured fleet intelligence and pre-emptive service relationships.

4. Every R&M; tender missed is a competitor locked in for years

When a public authority tenders for fleet maintenance and the winning maintainer has no relationship with an authorised Isuzu dealer, that maintainer will source parts from whoever can supply them fastest. That is typically a regional IAM wholesaler. Once that sourcing relationship is established, it is operationally embedded: the garage knows the SKU, the wholesaler knows the account, the invoicing is set up. Breaking that relationship 3 years into a contract requires the authorised dealer to offer significant price or service advantage. **The window to intervene is at contract start, not at renewal.**

This dynamic is particularly acute for R&M contracts, where the lock-in is contractual and multi-year, not just habitual. A missed R&M tender is not one lost parts order — it is 3–5 years of genuine parts revenue ceded to an IAM operator, for every vehicle in that fleet, with a renewal cycle at the end that the IAM operator will defend as the incumbent. The tender monitor's automatic R&M flag exists precisely because these are the tenders where intervention at the right moment — before award — is the only moment that matters.

Cost category	Estimated annual impact	Notes
Genuine parts revenue gap (UK)	**€3.5M+**	Internal gap analysis. Authorised channel capture materially below addressable parc.
Kosha shortfall vs. market growth (FY2031)	**~€8.9M**	Gap between Kosha target and what market CAGR alone delivers.
GP margin compression (per Kosha plan)	**–11pp by FY2028**	GP% falls from 37.4% (FY2025 actual) to 26.1% (FY2028 Kosha). Volume growth without margin protection compounds the problem.
Reputational / competitive risk	Unquantified	Competitors embedding fleet data connections now will be structurally advantaged in 5 years. First-mover advantage in fleet intelligence is real.

SECTION 5

Zero Cost to Start — and a Framework for Winning When Price Is the Objection

One of the most common reasons organisations delay acting on intelligence is the assumption that doing so requires budget, headcount, or a vendor contract. This section addresses that objection directly — and then goes further: when cost becomes the barrier in a tender itself, what do successful OEMs and other industries do?

The tender monitor: an intelligence asset that already exists

The ISZE Tender Monitor is operational. It requires no software licence, no external vendor, and no ongoing cost beyond one person reviewing output for one morning per week. In the most recent run it processed 579 procurement notices across 27+ markets. The cost per notice processed: zero.

Approach	Annual cost	Coverage	Time to deploy
ISZE Tender Monitor (current)	€0 software + ~4h/week staff time	27+ markets, UK, Israel — auto-updated weekly	**Already live**
Commercial tender intelligence platform (e.g. Tracker, Tenders Direct, B2G)	€8,000–€25,000/yr licence	Broad but not Isuzu-specific. No scoring, no DB brief generation.	Weeks (procurement + onboarding)
Ford Pro Intelligence platform (internal investment)	Hundreds of millions capex	Real-time vehicle telemetry, 1B data points/day	Years of development

Ford Pro's investment benchmark is illustrative — their platform was built over years and covers a much broader brief. The point is not to compare scope but to note that ISZE achieves meaningful fleet intelligence coverage at a fraction of the cost of any commercial alternative.

When price is the objection in a tender — a five-tier response framework

In EU public procurement, evaluation criteria are published and fixed before the tender closes. If price carries 40% of the evaluation weight and Isuzu's vehicle costs more than a Ford Ranger, that gap is structural once the tender is live. The framework below addresses this at each stage — before the tender opens, in how the bid is constructed, and over the medium term. Each tier is drawn from practices used by successful OEMs and from other sectors that have solved the same problem.

Tier 1 — Influence criteria before the tender opens

Cost: DB time only. No price concession required.

- Most public authorities issue a Prior Information Notice (PIN) before a formal tender. EU procurement law explicitly permits market dialogue at this stage — and most large OEMs have dedicated pre-sales teams whose sole job is this engagement.

- When the tender monitor flags a PIN, the DB contacts the buyer during the consultation period. The goal: understand their fleet priorities and — legitimately — suggest evaluation criteria that include lifecycle cost, service network density, parts availability, and uptime guarantee alongside purchase price.
- A tender scored 40% price / 60% quality is structurally easier to win than one scored 70% price / 30% quality. The tender monitor's PIN detection makes this action possible. Most of Isuzu's network is not doing this today.

Tier 2 — Pilot fleet strategy

Cost: ISZE provides a clear pilot pricing policy — one internal document.

- For tenders covering 30+ vehicles where cost is the barrier, the DB proposes a pilot of 5–10 units at competitive pricing, with a contractual framework for full fleet expansion at renewal.
- Smaller value means less competitive pressure, simpler procurement process, and a lower financial barrier for the buyer. The pilot demonstrates Isuzu's TCO and service quality in the buyer's own operating environment — the most persuasive evidence available.
- This is the standard Caterpillar approach when entering a new fleet customer. The pilot is priced to win; the renewal is priced to margin. Every large Isuzu fleet started as a small one.

Tier 3 — Bundled maintenance bid

Cost: ISZE develops one standard maintenance contract template for DBs to use.

- Rather than bidding on vehicle price alone, the DB bids on vehicle plus a 5-year genuine maintenance contract as a single package. The vehicle purchase price becomes higher, but the total fleet cost is fixed and predictable.
- Public sector finance departments strongly prefer predictable opex over variable maintenance budgets. A bundled bid also disqualifies pure fleet brokers who cannot service the vehicles — narrowing the competitive field to operators with genuine service capability.
- This is precisely the model Ford Pro and Stellantis have copied from each other. It is executable today by any DB with a service bay. ISZE's role is to provide the contract template and SPA pricing that makes the economics work.

Tier 4 — Total Cost of Ownership positioning kit

Cost: ISZE compiles data into one reusable one-pager. All inputs already exist internally.

- Toyota Fleet explicitly provides fleet managers with a 5-year TCO calculator comparing purchase price, maintenance frequency, service intervals, parts cost, and downtime. Isuzu has a strong TCO case — D-Max reliability and service intervals are competitive — but the argument is never packaged for DB use.
- ISZE builds a single TCO comparison document: Isuzu D-Max vs. Ford Ranger vs. Toyota Hilux over an 8-year fleet cycle, including parts cost benchmarks. This shifts the tender conversation from sticker price to 8-year operational cost.
- Used by the DB during pre-tender engagement (Tier 1) and included in bid responses. Requires no new data — service interval data and parts pricing already exist in ISZE.

Tier 5 — National framework agreement qualification

Cost: Significant one-time qualification effort. Requires IMIE lead. Realistic timeline: 12–24 months.

- Ford, VW, Toyota, and Stellantis dominate European public sector supply because they qualified for national framework agreements years ago. In the UK this is the Crown Commercial Service vehicle framework (RM6228). In France it is UGAP. In the Netherlands it is the central government procurement framework.
- Once on a framework, individual public authorities issue call-offs without running a full competitive tender. The price competition is resolved at framework qualification stage, not at every individual tender. This is the highest-leverage action available — and the one that most directly removes the price objection entirely.
- This requires IMIE (vehicle sales) to lead the qualification process, with ISZE committing to an aftersales service standard. It is not a short-term action — but every year without framework qualification is another year of competing tender by tender against brands that qualified a decade ago.

SECTION 5

Closing the Loop — Operational Intelligence from the Field

A tender monitor that only sends leads outward — and never receives feedback — is a one-way broadcast. The most valuable intelligence upgrades come from converting the platform into a two-way learning system. Two mechanisms make this possible with zero additional cost.

Post-tender debrief: what EU law already guarantees

Under EU Procurement Directive 2014/24/EU (Article 55), any unsuccessful bidder is legally entitled to request a debrief from the contracting authority. The authority must provide the evaluation scores and the reasons why the winning bid was preferred. This is a right most of Isuzu's distributor network never exercises.

Step	Action	What it produces
1. Tender closed — lost	DB requests formal debrief from contracting authority within 15 days of award notification.	Evaluation scorecard: price score, quality score, breakdown of where points were lost.
2. DB reports to ISZE	Simple one-form submission: lost on price / spec / network coverage / financial capacity / other.	ISZE builds a loss reason database. After 10–15 tenders, patterns emerge.
3. ISZE analyses patterns	If 70%+ of losses are on price for a specific vehicle class or market: SPA pricing review. If losses are on network: coverage gap identified.	Actionable insight that feeds pricing policy, SPA terms, and distributor support decisions.
4. R&M; award follow-up	When an R&M; contract is awarded to a third-party maintainer, DB identifies the winner and makes contact — positioning as authorised Isuzu parts supplier for any Isuzu vehicles in the fleet.	Parts revenue from won-by-others contracts. The tender loss becomes a parts sales lead.

The intelligence loop in one sentence: the tender monitor finds the opportunity, the DB acts on it, the debrief explains why it was won or lost, and ISZE uses that feedback to sharpen pricing, SPA terms, and the next bid. After 12 months of running this loop, ISZE will know more about European public fleet procurement patterns than any competitor in its segment — at zero incremental cost.

SECTION 6

Recommendations

The following actions are sequenced by effort and time to impact. The first three are executable within the current ISZE resource base with no additional budget.

Immediate (0–4 weeks)

- Formalise the weekly tender monitor run as an ISZE operational activity. Assign one owner responsible for reviewing leads and routing to the right distributor.
- Define the lead routing protocol: which country goes to which DB contact. Use the existing DB brief template — no bespoke writing required per lead.
- Establish a simple confirmation loop: when a DB receives a lead brief, they confirm receipt and initial assessment within 5 working days. Track in a shared log.

Short term (1–3 months)

- Pilot the full pipeline with the UK as the first distributor market — the most data-rich starting point with verified parc data and the clearest genuine parts revenue gap.
- Run the tender monitor output against the DVLA parc data. Where a tender buyer appears in the parc data as an Isuzu fleet operator, flag as high-priority.
- At the next distributor review cycle, present the tender pipeline as a standing agenda item alongside the KPI matrix. This signals that tender engagement is a managed activity.

Medium term (3–12 months)

- Extend the pilot to two additional markets based on where tender volume is highest (Romania and Poland show strong TED activity; Germany below-threshold gap is addressable with DTVP portal access).
- Develop a simple aftersales onboarding protocol for new fleet wins: when Vehicle Sales notifies the Aftersales dept. of a fleet delivery, trigger an automatic genuine parts welcome contact to the new fleet operator.
- Build the Competitiveness Dashboard connection: use tender data to validate whether ISZE's pricing is competitive for the contract sizes being tendered. Class C sensitivity analysis is already underway (Pricing-2026 project).

SECTION 7

Appendix — About the ISZE Tender Monitor

The ISZE Tender Monitor is a Python-based platform that scrapes public procurement portals weekly across 27 European markets, Norway, Finland, Israel, and the UK. It classifies every notice against ISZE's CPV target list, scores it on three dimensions (Fit, Win, Econ), and generates a distributor-ready lead brief per opportunity.

Source	Coverage	Status
TED (EU Official Journal)	27 EU member states + above-threshold DE, FR, ES, IT, PL, RO…	**Live**
Find a Tender (UK)	UK above-threshold public contracts	**Live**
Contracts Finder (UK)	UK lower-value contracts (councils, NHS, police)	**Live**
Doffin (Norway)	Norwegian public procurement	Requires free API key
HILMA (Finland)	Finnish public procurement	Requires free API key
Israel MR Gov	Israeli public procurement (RSS)	**Live**
DTVP (Germany)	German national portals — below-threshold	**In progress**

Scoring model

Each notice is scored on three axes: **Fit** (strategic alignment with ISZE portfolio — CPV codes, brand signals, service terminology), **Win** (action feasibility — timing, data completeness, tender stage), and **Econ** (commercial value — contract size, recurring potential, fleet scale). The composite score drives a four-level decision: **Attack / Selective / Watch / Ignore.** R&M contracts always route to Watch with a parts-supply approach brief regardless of score.
