COMMERCIAL MODEL

How aftersales money is won — and where it leaks

One connected commercial model: fleet → wallet (GPS) → jobs (PMS) → BVP mix → tender / R&M pipeline → decisions. Built for stakeholder conversations with Isuzu Motors Limited — every figure traces to a named source.

FROM PRISM EXPLAINER · §1

One number needs three layers

A euro of parts revenue means nothing without the fleet. PRISM never reports a raw figure without anchoring it to surviving parc (UIO). GPS and PMS both divide against that denominator — at different resolution. They are siblings, not a chain.

LEVEL 0

The fleet

Source of truth: IML vehicle registration data. Surviving parc ≠ total registrations.

Rule: no sales figure is quoted without the surviving-parc denominator. A small fleet with strong €/truck can outrank ten times the sales.

CLICK TO EXPAND

LEVEL 1

UIO — Units in Operation

Surviving parc, IML, annual. The shared foundation under GPS and PMS.

CLICK TO EXPAND

LEVEL 2A · GPS

Genuine Parts Spend / Share per Unit — Net Sales € ÷ UIO = € per truck per year. Macro view: distributor × year. Answers *"how much of the parts wallet?"*

Traffic light: >€150 healthy · €50–150 at risk · <€50 critical. CY2025: 15 green / 3 amber of 18 markets. Tender brief £580/veh/yr ≈ full-capture ceiling — GPS below that band is the same wallet story, measured after SaTy netting. **Denominator trap:** MIDI (~98,654 UIO, zero ISZE-direct sales) is excluded from the network GPS waterfall — its ~€15M theoretical wallet was dropped 2026-07-02 so CY2025 re-based 40.2% → 50.2% (later 51.1% with CR/RE). Never put non-customers back in the parc denominator.

LEVEL 2B · PMS

Preventive Maintenance Service coverage — Actual PNs sold ÷ Expected demand = Capture %. Micro view: distributor × model × PN. Answers *"are we winning the service jobs?"*

CY2025 wear-part capture 13%–64% — not one market clears two-thirds. Rankings do not move with GPS.

a distributor can look GPS-green while still losing most oil filters, brake pads and clutch jobs to the aftermarket. Collapsing them into one blended score would hide that — which is exactly why PRISM keeps them independent.

FROM PMS_SERVICE_INTERVALS.MD · OEM SCHEDULE PDFS · EU CONF AGENDA

Service intervals → expected demand → capture %

Capture % = . Numerators are hard; denominators are modelling assumptions until IML locks the ratio. OEM maintenance schedule PDFs under `01_data/03_PMS/service_schedules/` are the intended physical source for those assumptions.

How expected demand is built

`base = UIO × services_per_year × addressable` · consumables = base × factor · wear = base × wear_factor · capture = actual ÷ expected (uncapped in pipeline).

0.5
N75 svc/yr (ITUK/UTI truck) · PRISM default scope

1.0
LCV svc/yr (IUK/UMI D-Max)

1.25
IML v7 oil/fuel/air · ITUK external lane

0.5×
Air filter provisional (flag C) · not IML-confirmed

Quote rule: air-filter capture only "on a provisional interval assumption" until IML confirms. Schedule pack on disk: RG / RG21 / RT56 / RT88_93 / GIDSS N & F series PDFs — generation-aware LCV split still blocked on SCR vs non-SCR cutoffs.

EU Conf 26 Parts Sales — agenda hook

Mainz deck TOC puts **Genuine Parts incl. PMS** and **Repair & Maintenance** as peer agenda blocks — the same sibling split this model uses (wallet jobs vs R&M lock-in). Mid-term plan tables (FY2026–29 targets) are the Kosha/growth pressure the tender brief monetises as "need mechanisms beyond market CAGR."

FROM PRISM EXPLAINER · §2

How a number actually gets made

Nothing on a dashboard is typed by hand. Nothing queries SAP live. Four stages — each a file on disk.

STAGE 1

Raw sources

- IML vehicle registration
- SAP / ERP billing export
- ITUK PMS part guidance
- BVP parts catalog

STAGE 2

Build scripts

- 41 scripts
- One script · one output · one purpose
- Re-run on demand

STAGE 3

Derived datasets

- 100+ flat files (CSV / parquet)
- No live database
- Only thing the app reads

STAGE 4

App · PRISM

- 19 dashboard pages
- Read-only
- Scorecard / Review Pack PDF

Verification gate — 106 checks must pass before a refreshed number reaches a dashboard or a deck. Freshness = last pipeline run, not a silent ERP query.

Connects to: JUMP

Why UIO sits under every number → | SaTy keep-set (FACTS) → | Judgment calls the gate does not resolve → | FACTS.md rule →

FROM FACTS.MD · SATY KEEP-SET · FLAG H

SaTy strip — how order type changes the spine

SaTy is not a product lane. It decides which SAP lines enter GPS / parts base / PMS actuals. Numbers below are canonical FACTS — if a deck disagrees, the deck is wrong until proven otherwise.

€103.57M
GPS-facing parts base (ex CR/RE · snapshot 2026-07-03)

€1.65M
280 SaTy CR/RE rows excluded · 2023–2026

51.1%
Network GPS CY2025 after re-base + CR/RE

Flag H · reversible →

SaTy node →

FROM PRISM EXPLAINER · §4 · + BVP STRATEGY

What “capture” actually counts

Every PMS figure adds genuine + BVP. Only aftermarket is treated as loss. A euro that moves genuine → BVP is still an ISZE euro.

Network PMS wear-part wallet · CY2025

€5,768,026 total captured (network) — Genuine €4,536,346 · BVP share of captured wallet 21.4%. 100% of this bar is ISZE revenue.

Only loss = aftermarket (Bosch, Febi, budget brands). Customer money leaves ISZE entirely. Rising BVP mix is a margin-quality signal — not leakage to “fix” by chasing customers back to full-price genuine when the alternative is €0.

BVP contested basket (strategy)

83.5%	€4.38M
BVP share of contested-basket € (paired genuine↔BVP parts)	Contested basket revenue · 7 families · CY2025

Strategic question is not “push BVP?” — it is where BVP is incremental vs where it would cannibalise Golden Window genuine. Tier 1 (approved): deploy hard where genuine is already lost; hold oil filter / ITUK–UTI strongholds.

Connects to: JUMP

GPS green ≠ jobs won →

R&M forces capture toward 100% →

BVP flow on connection board →

BVP · PMS nodes →

FROM PRISM EXPLAINER · §5 · REAL PIPELINE CELL

Proof cell — IUK clutch discs · CY2025

Not illustrative. Actual Stage-3 output for one distributor × category.

47,783 UIO · IUK fleet	**9,557** Expected clutch discs / yr (0.5 svc)
429 Actual sold · €62,909 · 0 BVP	**4.49%** Capture · gap €1,338,473

Built by **build_pms_opportunity_matrix.py** → Stage 3 → PMS page. Same cycle: Action #1 on Pricing Action Map — IUK clutch, ~€2.3M wallet, 4–6% capture across the family. Street pricing is not the blocker (genuine at or below AM). **Loss is availability, not price** — only visible once traced this precisely.

Connects to: JUMP

Stage 2 script → Stage 3 file → | PMS micro layer → | ITUK dual-lane trap → | Why R&M would change this cell → | Decisions node →

FROM FACTS.MD · §1 / §1B · AIM · COMPETITIVENESS

ITUK dual lane + AIM ↔ pricing ↔ tenders

Two ITUK truths, deliberately separate. Mixing them in a tender×parc join or a deck is a silent error. AIM and competitiveness sit beside GPS/PMS — they score risk and street price, and should inform tender bids.

IML v7 lane (external standard)

22,389 UIO · full DVLA Mar 2026	€2.04M PMS revenue gap · 5 categories CY2025
35.9% Weighted cover (5 cat)	13.2% Air filter cover · largest € leak

Intervals: oil/fuel/air 1.25×/yr · clutch/brake 0.5×/yr · 100% addressable. Use for IML/ITUK decks and correspondence.

PRISM network lane (dashboard)

23,068 Bucketed UIO · cv_std + f_series	100% Oil-filter total capture CY2025 (capped)
88% Genuine share of that oil-filter actual	≠ Not the IML v7 headline — do not merge

Trap: tender×parc (DVLA) must name the lane. DVLA 22,389 for IML stories; 23,068 for PRISM capture league. Dual-anchor is deliberate (FACTS / DECISIONS 2026-07-17).

Designed join — AIM ↔ competitiveness ↔ tender pricing

AIM class / risk 93.5% classified (count) → **Competitiveness map** IAM / OEM-equiv exposure → **Tender bid / SPA** price objection tiers

Brief already asks to validate ISZE pricing against tendered contract sizes (Class C / Pricing-2026). **Wired today:** AIM dashboards + competitiveness HTML as separate surfaces. **Not wired:** auto "this Attack tender hits high AIM-risk / price-exposed categories" into the DB brief.

Connects to: JUMP

FROM TENDER INTELLIGENCE STRATEGY BRIEF V6 · + PRISM TENDER PIPELINE

Tenders — three actors, one pipeline

Public procurement is transparent and underused. The core problem is visibility: which public fleets have Isuzu, who maintains them, when R&M renews. Vehicle win without aftersales follow-through leaves parts to chance.

ACTOR 1

Vehicle Sales (IMIE)

Converts fleet vehicle purchase tenders. Early sight of PINs. New registrations fed back to ISZE as UIO immediately.

ACTOR 2

ISZE Aftersales

Runs tender monitor weekly. Qualifies leads. Routes to distributor. Owns fleet intelligence and SPA / genuine strategy.

ACTOR 3

Distributor (DB)

Local executor. Receives a pre-qualified brief — who to call, not tender jargon. Wins service / R&M, places parts with ISZE.

R&M contracts = highest-value tender type

Vehicle purchase places metal. **Repair & Maintenance locks parts for 3–5 years** — near-100% genuine capture on the covered fleet if an authorised DB wins; IAM lock-in if they don't. No new vehicles required — existing UIO generates the revenue. Monitor auto-flags R&M with a parts-supply brief.

- Benchmark: **£580 / vehicle / year** parts potential (UK True Sales) → 20 units ≈ £116k/yr · ~£928k over 8 years at full capture
- Ford Pro: **17% of EBIT** from aftermarket & services — vehicle is the door; aftermarket is the house
- Kosha FY2031 €52.1M target needs ~€8.9M beyond market CAGR — new mechanisms required

Monitor scoring · pipeline snapshot

Fit · Win · Econ → Attack / Selective / Watch / Ignore. R&M always routes Watch + parts approach. Sources: TED, Find a Tender, Contracts Finder, Israel MR Gov… 27+ markets.

3	245	152	308
Attack	Selective	Watch	Ignore

520 scored notices · PRISM Tender Pipeline export

Missing join (by neglect): tender leads do not yet feed PMS capture € or GPS opportunity automatically. Strategy brief recommends parc cross-check (DVLA) and Competitiveness Dashboard connection — still operational, not wired into PRISM KPIs.

Designed join — tender × parc (DVLA) · not built yet

From Tender Brief short-term recommendations: run monitor output against DVLA / UIO parc. Where the tender buyer already appears as an Isuzu fleet operator → high-priority lead. That is the commercial bridge from "public notice" to "this parc already moves our GPS/PMS denominators."

Tender buyer TED / Find a Tender × **Parc match** DVLA / UIO sold-to → **Priority flag** then DB brief · later → capture €

Today: monitor scores Fit/Win/Econ only. Parc match + auto GPS/PMS opportunity € = Phase 2 wire. FACTS keeps ITUK dual UIO anchors deliberate (PRISM 23,068 vs IML/DVLA 22,389) — parc joins must name which lane.

FROM PRISM EXPLAINER · §6

What the model admits it doesn’t know yet

The 106-check gate catches arithmetic drift. Judgment calls stay labelled — not smoothed over.

Air-filter interval — provisional

Expected demand uses a 0.5× factor (roughly every second service). Doubled measured air-filter capture network-wide the day it was applied. Not IML-confirmed — every air-filter capture number carries that caveat.

CR / RE credit notes — reversible judgment

280 rows · €1,651,149 (2023–2026) with credit/return codes on positive-value lines. Excluded from revenue / PMS by choice, not ERP confirmation. If SAP clarifies, one definition reverts and everything recalculates.

SaTy is behaviour, not product

VOR/RUSH → surcharge on net GPS. CR/RE → keep-set exclusion. Never treat SaTy as a category tree under BVP.

Tender → capture still unwired

Monitor + strategy exist; automatic join into PMS/GPS opportunity € does not. Brief’s UK parc cross-check and Competitiveness link are next commercial wiring — not done.

Lubricants / BESCO — optional side lane

Separate commercial programme (~€442K / ~13% GP in memory — verify before external use). Not in the GPS/PMS capture spine; do not fold into wallet % without an explicit join.
